Investigate

The Famous "Success" Incubator

Sold on Free Trial to Anyone Anywhere
130, 260, 340 and 612-Egg Size

This high class incubator before you buy any other at any price. We own our own building, pay no rents, and can undersell by many dollars all other dealers in incubators and brooders. All incubators are made from first grade clear redwood, wool padded tops, double walls, lined with heavy felt paper, hot water heating system, 14 oz. cold rolled copper heater, special long lever automatic self regulator. Our machines will hold an exact even temperature, no watching them at night. See them hatching thousands of chicks here any time. Our heater is better than any other used on any incubator at any price. Automatic in admitting fresh air. Investigate this machine and save many dollars and get the best at any price. Free 32-page book contains lectures on chick raising, etc. It's free, send for it today.

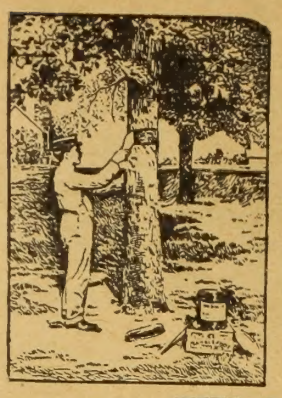
Use the Famous Rex Lime and Sulphur Solution

For spraying your trees and vines. Hundreds of carloads of these goods have been used on the Pacific Coast, giving the best of satisfaction for Scale, Scab, Red Spider, Red Scale, Apple Mildew, Grape Mildew, in fact, all kinds of insects and fungi that prey upon California Citrus and Deciduous Fruits.

Manufactured and Sold by the

California Rex Spray Company, Benecia, Cal.



TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials

The Pear Thrips Problem in California

Read Before the State Fruit Growers' Convention at Sacramento

By A. L. QUAINTANCE

In Charge of Deciduous Fruit Insect Investigations, Bureau of Entomology, Washington, D. C.

THE present critical situation in deciduous fruit culture in the San Francisco bay region in California due to the presence of the pear thrips (Euthrips pyri) furnishes but another illustration of how an injurious species previously obscure and unknown to science may suddenly become abundant and destructive and literally threaten the existence of a well founded industry, representing an investment of many millions of dollars.

The pear thrips came prominently into notice in the Santa Clara valley in the spring of 1904. The blasted condition of the buds and flowers of various fruit trees attracted the attention of several orchardists, and specimens of the "new insect" were brought to the attention of the State Horticultural Commissioner. The importance of the insect as an enemy of deciduous fruits was promptly recognized by the Horticultural Commissioners of Santa Clara county, and the County Entomologist, Mr. Dudley Moulton, at once began a careful investigation of its injuries and life history, and conducted certain experiments with remedial measures, the results of which were published in 1905 in a bulletin from the office of the State Horticultural Commission.

Upon his employment by the Bureau of Entomology, in the spring of 1906, Mr. Moulton prepared an article on the pear thrips giving the essential facts concerning the insect as determined in his earlier investigations and also additional information subsequently obtained. This paper was issued in 1907 as part 1 of Bulletin 68 of the Bureau of Entomology, and furnished a fairly complete account of the insect's biology.

Field Station.

The continued and increasing losses brought about by the ravages of the pear thrips led to the establishment by the Bureau of Entomology of a field station in deciduous fruit insect investigations, which was located at San Jose, in the Santa Clara valley, and Mr. Moulton, under the writer's direction, was placed in immediate charge. An additional man, Mr. Chas. T. Paine, was also detailed for the work in California in the fall of 1907. Both of these men, natives of the state, and trained entomologists, were regarded as exceptionally well equipped for the work, especially by reason of familiarity with local horticultural conditions. Practically all of the attention of Messrs. Moulton and Paine has been given to the pear thrips, and much additional information has been accumulated.

During the spring of 1908, extensive practical experiments were carried out, and a vigorous campaign of work is planned for the spring of 1909. The thrips situation has been carefully investigated by the writer in 1907 and also in 1908, and Dr. Howard made a personal investigation of conditions in the thrips infested territory during September of the present year. The Bureau at Washington is therefore closely in touch with the work, and everything possible within the limits of its appropriation will be done to bring about as speedily as possible the practical control of the pest.

Distribution.

The pear thrips at present occurs quite generally in the Santa Clara valley, and is present in orchards in Contra Costa county, in the neighborhood of Concord; in Solano county, in orchards in the vicinity of Suisun; in Yolo county and also in Placer county in the neighborhood of Newcastle. The insect is probably present throughout this general region of the state, and will unquestionably further spread, though perhaps not rapidly, unless introduced in localities in ways other than by its natural diffusion. It is also quite probable that the insect will eventually make its appearance in other states on the Pacific Coast and that it may make its way to Eastern orchards would not be at all surprising. The pear thrips, therefore, is an insect of more than local interest, and its satisfactory control is a matter of importance for the fruit growing industry as a whole.

Character of Injury and Habits of Thrips.

No remedial work with an insect may be undertaken with a reasonable hope of success, except as based on a knowledge of its life history. The small size of this insect has made it an unusually difficult one to study carefully. Nevertheless, Mr. Moulton has been able to determine many facts concerning the behavior of the insect, covering its entire life cycle from year to year, and his painstaking work is much to be commended.

The adult thrips put in its appearance on the trees late in February and early in March, at which time such fruits as almonds, apricots and peaches are coming into bloom. From the middle to the last of March and early in April the insects are out in maximum numbers, when prunes, cherries and pears are in full bloom. The thrips attack the swelling buds, working down between the bud scales and by feeding upon the essential organs of the young flower, or other parts, soon destroy it. In the case of some fruits, like the almond and peach, these may suffer comparatively little injury if they are not attacked until the period of full bloom. The thrips feed upon the nectar in the calyx-cup and the little fruit itself may thus escape. The insect is worse on pear, prune and cherry as it is most abundant during the period of swelling of buds, and of blooming, and, furthermore, the fruit buds are developed in clusters. Buds of these fruits are, in extreme cases, so injured that they wither and die before opening, and even after the blossom has expanded the little fruit and other parts may be attacked and prospects for a crop quite destroyed. Leaf buds are also attacked in the same way and the destruction of these may be so general that little foliage is put out, and it may be some months before a natural growth is developed. The small size of the thrips, and its habit of working within the buds and flowers is calculated to prevent its detection by fruit growers, and much thrips injury has doubtless been attributed to the effect of cold. On the other hand, the insect has been charged with injury properly due to unfavorable weather conditions.

A Bit of Its Life History.

The adult female thrips (no males are known) deposits her eggs in almost any tender part of the plant, as the fruit and leaf stems, the mid-rib and veins of the leaves, etc., by the aid of a saw-like ovipositor, with which a slit is cut into the tissues and the egg inserted within. The egg hatches in the course of about four days, and the young thrips wiggles its way out, and soon begins to feed on the tender tissues of the plant. These larvae were at first very small, and when full grown are scarcely one-twelfth of an inch in length. They prefer secluded places as on the under surface of tender leaves, the growing tips and under the protection of the dried up calyx before it has been thrown off by the swelling fruit. In this latter situation they feed upon the young and tender fruit, and in the case of prunes and pears, the injured places develop as the fruit grows, into scabby spots greatly disfiguring its appearance and resulting in serious deformities, especially with pears. This injury by the larvae to the fruit which may have escaped the adults, is very important, and in badly infested orchards a large per cent of the remaining crop may be thus injured. The scabby spots on prunes do not shrink uniformly with the rest of the skin and stand out very conspicuously, materially reducing the grade.

When full grown, which requires about three weeks, the thrips larvae make their way to the ground and penetrate the soil, to a depth from 3 to 10 or 12 inches, depending apparently upon whether this is soft or hard, the majority in tilled orchards going down some 6 to 10 inches. Below the soil each larvae constructs for itself a little earthen cell of sufficient size to accomodate its body, and here the insect remains until the following spring, to appear as an adult during the flowering period of the trees, as already stated. In the late fall and winter, however, the larvae transforms to the pupa stage, and in this condition is much more helpless than as larvae. It is not known how long the pupal stage continues but it is probably several weeks. There is thus but one generation of the thrips each year, and they spend much the greater part of their time safe below the surface of the soil.

Some Characteristics.

The mouth parts of the thrips present an interesting difference from those of insects of other orders, and a knowledge of these organs is of importance to fruit growers. There is a snout-like projection, armed with several spines. Within the snout are stiff setae, or stylets, with which the epidermis of the plant surface is first penetrated, and then by aid of the bristles on the rim of the snout the opening is enlarged, the tissues lacerated, and the juices thus liberated, sucked up for food. The thrips thus feeds, practically, on the interior portion of the plants, and can not be destroyed with arsenical or similar poisons.

Food Plants.

Practically all deciduous fruits are attacked, as almond, apple, apricot, cherry, peach, pear, plum and prune. The insect is also recorded from fig, grape and walnut, and such indigenous plants as Madrona, wild California lilac and poison oak.

* * *

How May Thrips Be Controlled?

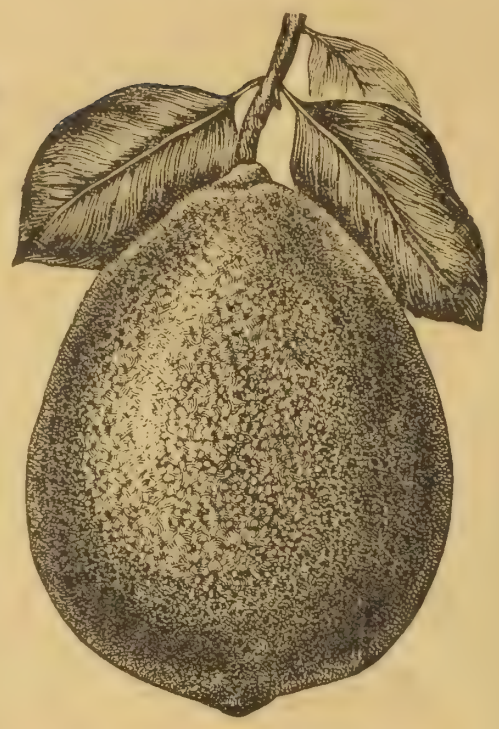
Unfortunately this question cannot be satisfactorily answered at the present time. From the resume of the life history of the pest above given, the extreme difficulty of controlling the adults with sprays is evident. At first thought it might appear useless to try such methods; nevertheless, considerable time has been given to testing various sprays, as to their possible efficiency against the adults, and also against the larvae. During the past spring Mr. Moulton has tested, at different strengths, the following:

Whale Oil Soap; Black Leaf Tobacco Extract; Tobacco Decoction from stems boiled in water: Kerosene Emulsion; Distillate Oil; Crude Carbolic acid Emulsion; Cresote Oil; Lime

Continued on Page 6.

The Wonderful New

Ponderosa Lemon



This truly ever-bearing variety produces lemons of remarkable size. The trees are strong and healthy, easily cultivated and enormously productive. They bloom and bear fruit when quite young. The flowers are pure white, with yellow stamens, and as fragrant as orange blossoms. The beautiful foliage is thick, glossy, and resists insect attacks admirably. A tree of this sort, covered with masses of flowers and large, handsome lemons is a sight to behold. The lemons are excellent for culinary purposes. Usefulness and beauty are combined in a high degree in this remarkable plant. Send for catalogue.

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

With the Citrus Growers

CITRUS TARIFF.

THROUGH the courtesy of Gen. L. A. Cooke, retired, and now located at Lemon Grove, San Diego County, we have a copy of the San Antonio Daily Express containing items regarding citrus imports from Mexico. These items show plainly that our only menace is not along the eastern seaboard, but nearly at our own doors. Possibly the Ways and Means Committee will "deal kindly with the fruit-growing industry of Mexico;" but it appeals to us that protection is a principle invoked to aid Americans, rather than the producers of another country. We believe the Ways and Means Committee have the same idea.

The items in the Express follow:

"George N. McDonald, successful fruit grower of Tampico, is in the city and is negotiating with local commission firms for the sale of a carload of grape fruit and tangerines which has just reached the city. Mr. McDonald was formerly an attorney of Washington, but has devoted the last seven years toward giving the 'Burbank' touch to this and other fruit he is propagating.

"Though extremely modest as to his accomplishments as a wizard, the fruit itself gives evidence that scientific methods will in time make the sister Republic a very formidable competitor of any fruit-growing region of the United States.

"'We will be able to do this,' said Mr. McDonald, 'in spite of the import duty of one cent a pound we are compelled to pay, for our fruit will be worth a cent a pound more by reason of its quality. Though we have been laboring under great difficulties, Americans in Mexico are becoming so numerous that the fruit growers are getting some encouragement in the hope that both governments will be able shortly to effect a reciprocal agreement that will encourage us to even greater efforts in fruit production. Now that the agitation of tariff measures is on in Washington, we indulge the hope that some relief will come to us if Mr. Taft is really in earnest about a genuine revision of the tariff. Mexico admits free of duty all live stock to be used for breeding purposes and we feel that the United States should see her way clear to deal kindly with the fruit-growing industry of that country.

"'Fruit is a necessity to the poorer classes and means much to them from the standpoint of health. This is the class you know we have with us always. Free entry for the necessities where possible is what brings prosperity and happiness. I have sold fruit in San Antonio for four years, but this is my first shipment by rail, and I hope the results will justify the adoption of the quicker route, my former shipments having been by water to Galveston.'"

. . . . . .

Another, marked "Special Telegram to the Express," is as follows:

"Monterey, Mexico, Dec. 21.—Montemorelos, a thriving orange-growing center near this city, is supplying the entire holiday trade of Mexico with choice oranges, in addition to which hundreds of carloads are being shipped to the United States."

In the market reports on fruits we note the following:

"Among the arrivals of the day was a carload of grape fruit and tangerines from the Tampico district in Mexico, which demonstrates a very creditable effort on the part of the fruit growers down there to compete with California and Florida. The grape fruit is quoted at $5.50 per box, and ranges in size from 46s to 64s, and the tangerines at $3.50 per box."

The question for our politicians is do they wish American laborers to work for the same price as Mexican laborers.

ORANGES TO EASTERN MARKET BY WATER.

Some weeks ago the Cultivator spoke of a trial shipment of oranges and lemons to New York via the American-Hawaiian S. S. Co., the Tehuantepec railway and steamers to Atlantic points. regarding this effort in an interview in a San Diego paper Senator Wright says: "The report on harbors," "deals with the possibilities of commercial development of the various harbors of the state. This is for the purpose of showing the necessity of improved harbor facilities such as the construction of seawalls and wharves. In this connection we used one of the American-Hawaiian line steamers for the purpose of determining whether or not San Diego could be made an important shipping point for transporting oranges and lemons to the East. A short time ago a number of boxes of oranges and lemons were bought in the open market of San Francisco and were then shipped by water and the isthmus to New York. The fruit had originally been picked in Southern California before going to San Francisco.

"The oranges arrived in New York in good condition," continued Mr. Wright, "but the lemons were somewhat damaged. However, had the oranges and lemons originated in San Diego, and had they been picked for that purpose, the lemons as well as the oranges would have arrived at their destination in a perfectly sound condition.

"The American-Hawaiian line, as you know, calls here on the northbound run from the isthmus and demands a guarantee of 200 tons before the steamers will call at San Diego on the south run. This, in my opinion, could easily be accomplished. The last steamer from San Francisco took 77 tons of citrus fruit of San Diego origin. If oranges and lemons of Southern California can be shipped east via San Diego and the isthmus, this port may become in the future the greatest shipping point in Southern California, and citrus fruits may be an important part of the cargoes of these large steamers."

Big Saving to Growers.

When such a development is attained it will mean a big saving to growers and shippers in the cost of freight. The freight paid to railroads for shipments of fruits made from Southern California last year aggregated $14,000,000. The estimated cost of shipping the same by water is estimated at 33 1-3 per cent less.

PRE-COOLING PLANT.

The Santa Fe Railroad will begin at once the construction of a great refrigeration plant at San Bernardino. Regarding this great plant the Sun of that city says:

The plant will be located on the Santa Fe's freight cut-off from Colton leading into the west end of the new freight yards, just to the southwest

of town. The site was purchased more than a year ago and the stakes recently set for the building and for sidings to accommodate the handling of building material. On the ground is a large well which will be used as a water supply.

When the plant is completed all citrus fruits and vegetable shipments handled by the Santa Fe for eastern points, will be pre-cooled at the local plant. Shipments from all the various branch lines will be constructed here and sent out in train loads after being cooled and iced. It will have a capacity of pre-cooling and icing a trainload of 32 cars every four hours or over 200 cars in 24 hours.

The building will be 140 by 1000 feet in size, the walls being 40 feet in height, the construction throughout being of solid concrete, reenforced with steel. The machinery to be installed in the plant will have a weight of three and a half million pounds and is one of the most expensive type.

The ice-making portion of the plant will have a capacity of manufacturing 225 tons daily and the refrigeration plant can handle 600 tons daily. There will be a four-track platform for the handling of cars for pre-cooling and icing. An ice storage capacity of 25,000 tons will be included in the plant.

BANANA CULTURE AT HAWAII.

But few realize that there are over sixty known varieties of bananas. Some of these differ in character as much as some of the different varieties of apples, yet the ordinary consumer imagines that all bananas are alike. Hawaii is said to have something over forty distinct varieties, most of which have been introduced by the whites. Some are extremely delicate and delicious, while others are used only for cooking purposes. There is scarcely a house, lot or homestead in Hawaii which has not a clump or two of bananas. These grow practically without care.

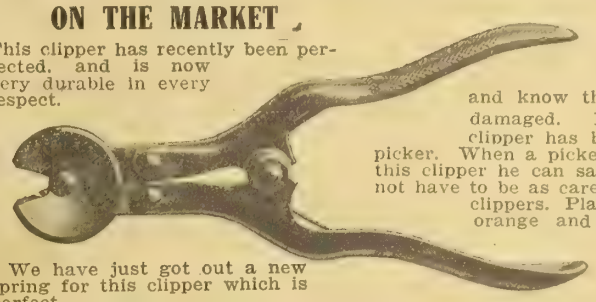
The irregularity of the steamship service has been of serious handicap to the development of the banana industry but the employment of steamers equipped for carrying the fruit in ventilated decks has in late years added a stimulus to the business. The United States Experiment Station plantings indicate that under proper selection of plants and cultivation the production of fruit per acre can be increased several hundred per cent under the antiquated methods in general use among the Orientals. The improved shipping facilities indicate that Hawaii promises to become an important banana producing section.

The Pacific Coast and especially in the Northwest is the field in which Hawaii can best market her fruits. At present Washington, Oregon and British Columbia are paying at wholesale $2,000,000 a year for bananas. These are imported from Central America by way of New Orleans and shipped by rail some 3000 miles. Honolulu is about 2400 miles by water from Seattle. A big field is opened in Hawaii for the cultivation of the choicer varieties. At present the mainland is supplied practically with one variety known as the Jamaica of Bluefield. The reason for this is that it stands transportation well. At the same time it is of fair quality and yields heavily. There are a number of more delicate varieties superior in flavor to the kind usually marketed, but these do not carry so well. Hawaii also produces large quantities of coarse fruit, which are known as cooking bananas. While the use of this product is confined largely to tropical countries it is believed that in time it will be recognized as an important product throughout the world.

When Hawaii was discovered only a limited number of food plants grew on the island. Even then bananas furnished a very important part of the daily diet of the natives, but since the Island has been visited by whites, banana cultivation has been wonderfully increased. Originally when the natives had control of the Island a very rigorous and despotic system was in vogue throughout the archipelago which prevented women from eating bananas under pain of death. It was not until several years after white inhabitants had become residents of the Island that this edict was revoked. —Chicago Produce News.

THE ONLY ABSOLUTE SAFETY ORANGE AND LEMON CLIPPER ON THE MARKET.

This clipper has recently been perfected, and is now very durable in every respect.



We have just got out a new spring for this clipper which is perfect.

An orange grower can send this clipper, with an inexperienced picker, into his grove and know that his fruit will not be damaged. By an actual test this clipper has been proven to be a fast picker. When a picker becomes accustomed to this clipper he can save time, because he does not have to be as careful as he does with other clippers. Place this clipper on top the orange and cut the stem, and the stem will not have to be cut the second time. One picker picked 98 boxes of oranges with this clipper in 9½ hours, the second day he had used the clipper. A Japanese picker picked 120 boxes of oranges with this clipper in one day. A great many orange growers are using this clipper now, and they say, after using this new clipper, they would not think of sending any of the old style clippers into their groves. How can an orange grower afford to send an old style clipper into his grove when, after a thorough investigation, it was found that the old style clippers were causing from 40 to 60 per cent of the orange decay? This clipper costs you very little more than the old Wiss clipper, and not as much as some other clippers. We are pleased to send a sample clipper, for trial, to any one, with the understanding that they return the clipper to us if they are not satisfied with it, after giving it a good test. We make special prices on these clippers in lots of a dozen or more. This clipper will cut the stems right down to the rind, and it is positively impossible to damage the fruit with it.

THE PEAR THRIPS PROBLEM

Continued from Page 3.

Sulphur Wash; Arsenate of Lead Molasses Spray; Arsenate of Lead and Crude Oil Emulsion.

Of these several substances none proved especially effective except the proprietary tobacco extract, and the distillate emulsion. Mr. Moulton concluded that by timely and thorough use of either of these sprays, directed especially against the larvae on the under surface of the leaves, these can be destroyed in such numbers as to result in protection of the crop for the succeeding year. The possibility of doing this will be fully tested during the spring of 1909, and the work will be done under the most favorable conditions for success. To be effective, however, spraying operations must be done on a large scale to prevent possible overflow of the insects from untreated orchards. It is planned to carry out spraying operations in Santa Clara county, Contra Costa county, and, if possible, in Solano county. Spraying for the thrips, should this prove effective, will offer, however, several practical difficulties. Two or three applications of sprays will be necessary, perhaps, and in so short a space of time as to tax the resources of the orchardist to accomplish the work.

In the Soil.

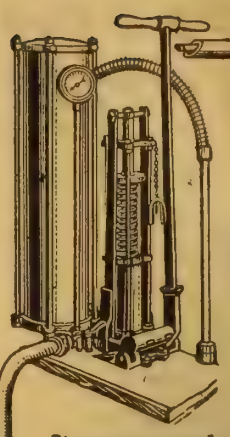
The destruction of thrips during their long stay in the soil, if it may be accomplished, would be a much more practicable solution of the problem. Mr. Moulton and Mr. Paine during the past summer have been carefully investigating various points connected with subterranean life of the insect, as to their distribution in the soil; the effect of cultivations as possibly disturbing them in their cells, and also the possibility of destroying them by protracted submergence in water, as might be practiced in irrigation. This work thus far has necessarily been confined to the insect in the larval stage, but will be begun against the pupae as soon as these appear in the early winter. While the results thus far are not especially hopeful as against the larvae, it is not improbable that a method will be found effective against the more helpless pupae. In addition to cultural methods, irrigation, etc., the possible effectiveness of various fertilizers, chemicals and fumigants will be tried and it is hoped that some practical expedient will be developed from the coming season's work.

More Help Coming.

An additional man has already been detailed to the thrips work in California, and another will be dispatched early in December. The four men thus assigned will be able to carry out experiments and demonstrations on a larger scale than has been possible heretofore.

Is It a Native.

The sudden appearance in California of the thrips in such destructive numbers suggests that it has been introduced from abroad and the opinion has been expressed that the species is a native of Southeastern Europe. The genuine Euthrips, to which the pest belongs, is represented in the United States by several species, and also in Europe, so that nothing may be inferred as to its nativity from the distribution of its nearest relatives. A search of European literature does not reveal a thrips of similar character and habits with Euthirps pyri. There is the possibility that it is a native of California, as its present occurrence in such destructive numbers finds parallel among numerous other native American insects. The Thripdae, as a group, on account of their small size and mode of existence, are relatively free from the attack of parasitic and predaceous insect enemies. The principal enemy of thrips, in the United States, aside from unfavorable weather conditions, is the insidious flower bug, Triphleps insidosus, which searches the flowers and buds and foliage of various plants impaling the thrips on its beak and sucking out the body juices. The alimentary canal of the thrips is often infested with nematode worms, but it is not certain that these are especially injurious. A fungus has been found by Mr. Moulton which, accord-



See That Patent spring?

It means much to the fruit grower who realizes the need for effective spraying, but deplores the ordinary pump with its exhausting labor, its unsatisfactory spray and its continual clogging and bother. This spring is found only in

Bean Magic Spray Pumps

It would be found in others, but the Bean Patents prevent it. This spring divides the work, permitting the operator to do half the work at each stroke of the handle. And he works against but half the pressure indicated on the gauge. It saves just one-third the labor. Two sizes of Bean Magic pumps; both have Bean patent spring, non-clogging ball valves, and other exclusive features.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

I am prepared to furnish these trees and vines in retail or wholesale lots. Circulars sent to all who send for them.

S. H. Taft, Sawtelle, Cal.

ing to his observations, is parasitic upon the thrips, destroying them in considerable numbers. On the whole, it is not considered probable that any natural enemy of the thrips may be discovered, or will appear in orchards which will be of much use in bringing about its subjugation. It is likely, also, that the thrips will disappear of its own accord, and that its control must be affected by definite preventive measures as in the case of other well established pests, such as the codling moth, scale insects, etc.

TREES OUT OF ORDER

IT often happens that trees show signs of decline when they should be in their prime, adjoining trees being in full vigor and producing large crops of fine fruit. If such trees do not reveal root trouble or any other visible ailment and do not respond to a liberal supply of stable manure and water during the growing season, try a liberal dose of nitrate of soda. If this fails, dig the tree out and make fire wood of it. This is Prof. L. H. Bailey's advice. We would add, if the orchard is four or more years old, do not replace it with another tree unless the orchard be walnut, fig, or orange. It is useless to try to grow short lived varieties under such conditions, or trees of low valuation. There is no gain in doing so except where it pays to fertilize heavily and irrigation is easily and conveniently done. The extra room given to the adjacent trees will enable them to produce enough more, to more than make up what would be regained by replacing with a new tree and waiting for it to come into bearing. We have seen replacing tried many times with negative results. We refer to deciduous trees other than fig and walnut though apples may be included with them. It will pay to fill in vacancies in citrus groves if sufficient fertilizer and moisture are constantly present within reach of the newly planted tree and those within reach of it.

CORRECTION.

One of those perplexing errors which will occur in all printing offices was made in the Eucalyptus article by Theodore Payne on first page, second column of the Cultivator of December 17 in which a part of two paragraphs was omitted making the description of Viminalis and Rudis both incomplete and confusing. The two paragraphs should have read:

An Experience.

Some few years ago the writer experimented with 25 species at Thermal, on the Colorado Desert, and out of this number five proved successful These were as follows: Eucalyptus leucoxylon (Victorian Ironbark), Eucalyptus polyanthema (Red Box) Eucalyptus rostrata (Red Gum), Eucalyptus rudis, Eucalyptus viminalis (Manna Gum). Of these five the Eucalyptus viminalis grew much faster and straighter than any of the others; many of them being from 12 to 15 feet high in less than one year from the time they were planted. This tree, however, is not so desirable as some of the other species if a salable timber is the object, but as an ornamental street tree or for wind-breaks it is one of the very best.

A Fine Ornamental.

The Eucalyptus rudis has been planted very extensively as an ornamental tree on the deserts both in California and Arizona and has thrived so well that it has often been termed the "Desert Gum." There is little known about the timber of this species, however, and it is not generally considered of very much value. Of late a disease has attacked some of these trees and according to reports some of them are dying off, so for these reasons it is not likely this tree will be planted extensively.

The date palm orchard near Heber is claimed to have yielded 800 pounds of dates this year.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

New Cling Peach The Sims

Possesses all merits of Phillips Cling, without any of its faults. Fruit large to very large, almost perfectly round, skin golden yellow, of very fine texture, firm and rich with excellent flavor and clear yellow to the pit, which is quite small. The canning qualities of this peach have been fully determined by several years of actual trial, and we regard it as the very best clingstone, for canning, in existence today, and recommend that it be extensively planted. The following statement from Messrs. Griffin and Skelley Company, one of the prominent canning and dried fruit firms in California, bears out our statement as to the commercial value of this peach, for which we predict a great future.

Griffin & Skelley Company,
16 California Street,
San Francisco, Cal., Oct. 6, '08.

Mr. Geo. C. Roeding, President, Fancher Creek Nurseries, Fresno, Cal., Dear Sir:—Regarding the Sims Cling Peaches, samples of which were delivered to our cannery at Fresno.

We packed these samples and are most favorably impressed with them. We find the peaches to be of fine texture, rich color and particularly fine flavor, and the best late Cling Peaches we have ever had in our cannery. They seem to ripen between the Orange Cling Peaches and the Phillips, and there has been an urgent demand for Clings that would come in just at that time, as it would enable canners to materially increase their output of Cling Peaches, and we shall welcome the day when a sufficient quantity of these peaches is available for canning purposes. If we were planting today, we should certainly put out a considerable quantity of these Clings.

Yours truly,
Griffin & Skelley Co.

The Ornamental Garden

THIS MONTH.

Bulbs may still be planted. Lilies, hyacinths, narcissus anemones, ranunculi and the early gladioli may even be planted now. In the garden of the writer a bunch of fine plants of gladioli are already coming up with promise of early bloom.

If a good supply of the California poppy have not been sown liberal plantings should be made at once. In annuals, the shirley poppy, sweet peas (it's already late for sweet peas, plant them quick) and mignonette may be sown.

Roses and shrubs should be planted this month. Cuttings may be made of roses also of poinsettias and most other plants which grow from the longer woody cuttings.

All deciduous ornamental trees should be put into their permanent location at once. Deciduous vines, now dormant, are in good condition for removal.

CARE AND CULTURE OF CHRYSANTHEMUMS.

THE road to success in chrysanthemum culture is short and easy to travel. No plant yields more readily to treatment.

Starting Plants.

In the early spring the old plants of the preceding year will throw out many suckers from the main stock just below the surface of the ground. At some favorable time in March, April, or early May—April is best—break (not cut) slips from the tops of these suckers, and pinch from the slips all the leaves, except the bunch at the end. Let these slips stand in water for twenty-four hours and they will absorb enough moisture to keep them from wilting when they are set out; then plant them in sand placed in boxes to a depth of about six inches, planting them about two inches deep. Place these boxes in a sunny exposure and up from the ground; cover the boxes with painted glass or shaded glass, allowing a good circulation of air between the box and the glass, so that the slips will not be too much heated. These slips will take root in from two to four weeks if kept wet; the sand should never be allowed to dry out.

Setting Out the Plants.

When these plants are well rooted transplant them with care into mellow soil (never work soil wet) and shade them from the direct sun for a few days. It is well to have some plants in reserve to reset those that get broken off or eaten off by slugs or snails, or destroyed by other mischance. Plants must not remain long in sand after they are rooted as they will be weakened by lack of nourishment.

Growing Plants.

The plants will begin growing in about ten days after setting out; when they are from eight to ten inches high and have put forth at least two pairs of leaves, pinch out the terminal leaf bud. In a short time a branch will start at the axil of each leaf. Break off all these branches except two or three nearest the top. When these branches have made a growth of five or six inches and have put forth at least two pairs of strong leaves, pinch out the terminal leaf bud from each branch. Branches will, as before, start from each axillary bud; they must likewise be broken off, saving one or two on each branch. This topping process should be repeated several times, managing so that the last time shall be during the first half of July. Be careful not to have too many branches from three to six at last topping. If you have been timely and judicious in your topping, your plant will be about twenty inches at this last topping. Let the laterals that come after this topping grow to from two to four inches in length and then do your last breaking out of branches. Leave none but strong ones, and from three to six to the plant. You are now deciding the number of flowers you are to raise to the plant. and branches must guide you.

Disbudding.

You have now broken off your last branches late in July, and your plants now begin their vigorous growth. The strong branches will soon run up from three to four feet high. During this vigorous growing buds will begin to appear in leaf axils. From this time on success is only to the vigilant. None of these side buds must be allowed to grow. Each branch will indicate its determined stature by presenting at its terminal a bunch of flowers and leaf buds. We are now at the point where skill and knowledge are most needed, as well as the greatest vigilance. A little neglect at this point and you fail in your accomplishment, you will have a large number of flowers, but they will not belong to class A.

When the little buds that appear in a cluster at the very end of the lusty branch have grown to about half the size of a pea, all of them but one vigorous flower bud must be broken out. How are you to know the flower buds? If but three are there it will be the center one. You are likely to know it from its appearance. Those green leaf-like parts that are to form the sepals of the flower are longer and more pointed than those on the leaf bud. Much care must be taken in this disbudding. The stems to these buds are very brittle and break very easily. Hold the buds with one hand and take a stick like a toothpick and crowd off the buds which you wish to dispose of. You will make some mistakes here. If you should leave a leaf bud instead of a flower bud all is not lost. The leaf bud will make a branch which will in a short time present a terminal cluster like the one with which you have just dealt; then try again. This breaking out of buds must not be neglected for a few days, but must be attended to at the proper time.

Watering.

During the early period of growth the plants should not be kept too wet, yet never let the roots get dry. After the last topping water copiously. It is well to wash with the sprinkler the dust from the leaves about once a week; do this at the close of the day. Adobe soil will not stand so much watering as the loamy soil. Judgment must here be used.

Manuring.

By or before the middle of July mulch the ground to a depth of two or three inches with good stable manure.

Soil.

Any good native soil that is not alkaline is suitable for the chrysanthemum. I mean by native soil that laid in place by the ancient streams that made our valley. Lots filled from cellar excavations and street gradings are all right. There is a silt that is hauled from the beds of our creeks by some people which is not suited unless well mixed with adobe.

There is no subtle mystery about raising chrysanthemums. Do the right thing at the right time. The most difficult things to do are the rooting of plants and disbudding the extra buds in the terminal cluster.

Many people raise good plants by setting out the suckers, as each of them has a root. I have seen as good plants raised this way as from cuttings, but they are not so sure to make good flowers, and if this method of propagating is continued for two or three years the flowers will degenerate.—Mrs. G. S. Wills in San Jose Mercury.

Walnut Trees

Grafted or grown from carefully selected seed. Postal gets prices.

A. A. Mills, Anaheim, Cal.

Two acres of figs near Colusa gave to its owner a net $450 income per acre.

Small Fruits and Vegetables

THIS MONTH.

TIME for earliest spring planting is here. In the elevated more frostless section potatoes may be planted. Of course it is possible later frosts may catch them but the pleasure and profit in such early products is worth the trial. In such sections beets, cabbage, carrots, peas, turnips, lettuce, onions may all be planted. In the cooler regions lettuce, onions and radishes are hardy.

In the seed bed may be planted cabbage, cauliflower, pepper, celery and tomato for later planting. planting.

In the cooler sections where the wet and cold soil makes this too early for the first planting, it is wise to spade or plow under a good coating of stable manure and get ground in clean tilth for later planting. Such work lets in the air to the soil, kills out many insects aids in subduing fungi and generally benefits the soil. "Tillage is manure."

Fruit trees, berries and shrubs should receive prompt attention as to pruning and new ones should be planted.

ORIGIN OF VEGETABLES.

The potato, which was already cultivated in America when the continent was discovered, is spontaneous in Chile. It was introduced to Europe in 1580 and 1585 by the Spaniards, and almost at the same time by the English, who brought it from Virginia, where it had appeared about 1550. The sweet potato and the Jerusalem artichoke are also supposed to come from America.

Salsify is found in a wild state in Greece, Dalmatia, Italy and Algeria. According to Oliver de Seres, it has been cultivated in the south of France since the sixteenth century.

Turnips and radishes came originally from Central Europe. The beet root and the beet, which have been greatly improved by cultivation, are considered as the same species by botanists. The beet, only the stalk of which is eaten, grows wild in the Mediterranean islands, Persia and Babylonia.

Garlic, onions, shallots and leeks have long been cultivated in almost all countries, and their origin is very uncertain. That of the scallion is better known. It grows spontaneously in Siberia. One finds chives in a wild state throughout the northern hemisphere.

The radish, greatly modified by cultivation, probably had its origin in the temperate zone, but from what wild species it is derived is not exactly known.

The lettuce appears to be derived from the endive, which is found wild in temperate and southern Europe, in the Canaries, Algeria, Abyssinia and temperate Western Asia.

Wild succory is spontaneous throughout Europe, even in Sweden, in Asia Minor, Persia, the Caucasus, Afghanistan and Siberia. Cultivated succory is probably a form of endive, which is thought to have its origin in India.

Cabbage, like all vegetables which have been cultivated from remote times, is believed to be of European origin.

The artichoke is the cultivated form of the wild cardoon, indigenous to Maderia, the Canaries, Morocco, the south of France, Spain, Italy and the Mediterranean islands.

Asparagus had its origin in Europe and temperate Western Asia.

The origin of the egg plant is India; that of the broadbean is unknown, as also that of the lentil, the pea. checkpea and haricot. The last named appears to have come originally from America.

The carrot grows spontaneously throughout Europe, Asia Minor, Siberia, Northern China, Abyssinia, Northern Africa, Madeira and the Canary islands.

Chervil comes from temperate Western Asia, parsley from the South of Europe and Algeria, sorrel from Europe and Northern Asia, the mountains of India and North America. Spinach is supposed to come from Northern Asia.

For some twenty years past the crosnes has been used. This little tuber with fine savory flesh, which has long been cultivated in China and Japan, is probably indigenous to Eastern Asia.

The tomato comes from Peru, the cucumber from India and the pumpkin from Guinea.—Revue Scientifique.

SAUERKRAUT.

Solid heads of cabbage that have but little color, namely, red or green leaves, make the nicest kraut—cabbages commonly used in making slaw. There is no objection to using burst heads, if all the green is carefully cut away. Have your barrel or keg, pounder and spade thoroughly clean, and also have your spade sharp. Remove all loose and green leaves from the cabbages, quarter and remove the heart, then throw into the vessel with a sprinkling of salt; now with the spade chop the cabbages briskly; keep throwing in the prepared cabbage, and when quite a depth of cabbage has been chopped, say 18 inches, stir and salt until seasoned right for present eating. Take your pounder; we use a 4 by 4 timber, but the best pounder can easily be made as follows: Saw a timber 4 by 4 in a 12-inch length, bore a hole in the end and insert a broom handle. The pounder must be free from splinters and clean; pound vigorously until the juice comes over the chopped cabbage; throw in more prepared heads, chop with the spade, salt, and pound each layer until the vessel is almost full. Enough space must be left for the ferment, else the juice will run over and the kraut not be as good. At the last pounding the cabbage should be well covered with juice.

Spread a clean white cloth over the kraut; a wooden cover that will just slip inside the vessel; a heavy, smooth rock on this, and a clean cloth tied over the top of vessel. After fermentation, the rock, wooden cover and white cloth should be removed and washed; then replaced as before. We keep our kraut in a covered outhouse until severe cold weather. We never keep it in a cellar, although it may be as good a place to keep it.

When but a few heads are to be made up, we use a jar to keep it in, and chop the heads in a wooden bowl, using a common chopping knife. A beer bottle is the thing to use as a pounder in a jar of kraut. Other than the utensils, the proceedings are exactly the same as when using a barrel of heads.

Very little salt is required for a barrel of kraut, and as to the cabbage required, one cannot say, as the size varies so much. We use any variety of cabbage that has good solid heads.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

COWS.

WHAT the value of a good cow is on the farm is not enough considered. She gives milk, and that is used, but rarely is an account kept with the cow to see how certain is the profit each day the year around. The skim milk that goes to the chickens and pigs is rarely credited to the cow account but the poultry yard receives credit of the eggs laid. The pigs receive the credit of the money they bring in, and so it goes. The cow is like the wife, she gives her time readily and willingly and is not counted as a factor in earnings. Even the old rooster just now is shouting out "Look! look! at the eggs we have laid!" As he is too noisy to be overlooked the other animals are doubtless impressed with the value the old cock is to the ranch. The gentle cow never forces her personality on us but gives of richness of milk to keep the other animals growing, and gives nearly all the grain we feed her, back to us to put on the land to bring us increased richness of fruit and grain.

The Pacific Dairy Review has a brief editorial on an advertisement of a man that is willing to pay $100 each for twenty-five cows that will give three hundred pounds of butter per cow. The cows to be delivered free of charge on his ranch. While this would look like a money making proposal from a seller's point of view, yet the dairyman that has that class of cows to sell does not have to wait until he has twenty-five, for his neighbors will take them all at the ranch. Some years ago I made a sale of heifers from eighteen to twenty-four months old and realized ninty-one dollars a head for them. They were from two generations of cows that had produced over three hundred and fifty pounds of butter apiece. I sometimes hear of them from others that wish to buy similar cows. You see that this man is not likely to find anyone to furnish these cows delivered at that price.

Success.

The fact that a man advertises for these cows and appreciates their worth is no reason that he can keep them at that production. It is often said a cow is a machine; but no! she is an individual and if her likes are not understood and catered to, it soon shows in the diminished milk yield. I have sold many cows that were producing four and five hundred pounds of butter yearly and in few instances have the purchasers been able to develop from these cows others of like productiveness. It is often said to me, by men that desire the best, that they can buy better cows than they can raise. The fact is that they fail to realize that while the power to be great producer is in the heifer she must be trained to it the same as a horse is developed into a racer.

Sales.

There are many men that become fascinated with the idea of having a great herd of cows and will buy few or many of the heaviest producing cows they can find. They pay high prices and they often fail to even keep these cows up to the mark. In a few years comes a dispersion sale and they let their stock go, and they are dissatisfied with the whole business. They should then drop the idea that the dairyman is not their superior in knowledge, but they usually think it is "bad luck," not want of skill, that has made the herd unprofitable. These sales are the places for farmers of less means to buy good cattle. The old cows of fifteen or sixteen years sell for low prices. These cows will still give a few more calves, and these carefully trained to dairy work, make the lucky purchasers a breeder of fancy stock.

Testing Cows.

The value of the Babcock test for the cows comes in here, for, how many men know whether their cows produce three hundred or four hundred pounds of butter fat within the year? Without the use monthly of the Babcock test it is not possible to know how much the cows are bringing in by the year. The milkers always have their opinions as to which are the best cows in the herd and that opinion never is correct. The cow that pegs away day in and day out with an even flow of milk is the cow that pays the dividends; not the cow that gives a heavy yield at first and then tapers away to nothing.

Separator.

The separator too increases the butter fat by securing it all. If there are only a few cows, it still pays, in that the milk is sweet when it is fed to the calves and the cream is nearly all secured. On the ordinary farm the separator will not show the creamery result of leaving in the skim milk one-tenth of one per cent of butter fat; it will be more likely to leave two or three-tenths of a per cent in the skim milk. The lack of skill in the men in running it is offset in the wages, for a man that can run the Babcock and separator up to a creamery basis will have to be paid ten to twenty dollars more a month than if he had less knowledge. The ordinary milkers a few years ago regarded the Babcock test as witchcraft pure and simple.

Different Breeds.

No one should keep cows of a breed he does not like merely because some one has told him they were good dairy animals. While if the taste is not pronounced for one breed or another it may do to go slower and investigate a little as to the breed desired. The broader facts may be stated of the dairy breeds that they are profitable in one way, or another or under one condition or another. The point is, which can you buy most reasonably and which can you feed the most economically. Jerseys excel in richness of their milk; in the ease with which it separates under the pan system. This cow does well on heavy rich foods as grains and oil cakes. The Guernsey is a similar cow, a little larger animal, and gives the highest colored milk known. The yellow of this milk has caused more than one dairyman to have a bout with local inspectors about that "yellow color,

you know!" The Aryshire and the Durham are all-around cows, producing a reasonable quantity of milk of a reasonable degree of richness. The Holsteins are much larger animals and give the largest quantity of milk of any of the breeds, many of the grades having to be milked four times a day when fresh. This milk has a smaller fat globule and it does not rise well in the pan, the milk is homogeneous, therefore, and often keeps from souring longer in consequence of its even mixture. The per cent is lower than the other breeds, often absurdly low. I once owned a cow that gave milk that averaged by the year only two and two-tenths but she gave 101 pounds a day for the first two months after she was fresh, so in the end she reaches a good high yield of butter fat yearly.—M. E. Sherman.

HOW TO RAISE CALVES ON WARM SKIMMED MILK.

We get the following information of inestimable value from a bulletin issued by Prof. C. H. Eckles, professor of Dairy Husbandry at the University of Missouri.

"The calf should be taken away from its mother by the third day or earlier, and should have its mother's milk for about two weeks. When the calf is about two weeks old, the milk may be gradually changed to skim-milk, using about a week to make the change."

Importance of Sweet Milk.

In order to make a success of raising the calf on skim-milk, the condition of the milk must be uniformly sweet. Probably nothing can be done that will produce indigestion and scours with more certainty than to feed sweet milk one day and sour the next. The younger the calf the more sensitive it is on this point.

The proper amount to feed the calf the first two or three weeks is about five or six quarts per day, and no more can be given without danger of indigestion. As the calf grows older it will take more, but it is never necessary to feed more than eight or nine quarts per day and never advisable to feed over ten. The calf should never be given all the milk it will drink. The calves must be fed in such a way that each calf secures the amount intended for it.

It is best to feed milk warm at all times and especially important that it be in this condition for young calves. Cold milk will usually cause indigestion in a young calf.

Begin feeding the calves dry corn meal as soon as they will take it, and continue as long as the skim-milk is fed. Provide hay of good quality, or pasture after the calf is three weeks or a month old.

Plenty of Water Needed.

An abundance of clean water should be accessible at all times, or at frequent intervals, as the calf is not satisfied with milk alone as a drink, and wants to drink a little water at a time, quite often during the day. This thirst for water is often overlooked when calves are raised by hand, and as a result the calf is thirsty, as well as hungry, and gorges itself with milk when it has a chance. Salt should also be within reach when the calf is old enough to eat grain and hay.

It is very important that all utensils used for feeding be kept clean. The calves should be placed in the lightest and driest portion of the barn and will not do well in dark, damp stalls.

Many a calf that would make a valuable cow is sent to the butcher because the owner would sell his milk at a good price.

TO CURE WARTS.

The common way of removing warts, by tying a silk thread around, too often proves disappointing, in that the trouble returns in a short time, perhaps in a more malignant form.

A practical horseman declares this simple remedy to be a perfect cure:

Five cents worth of blood-root and ten cents worth of chlorate of zinc. Mix together in a paste and put on twice a day. After two or three applications grease with lard until the roots come out.

AWAY IN THE LEAD FOR 1909
DE LAVAL
CREAM SEPARATORS

The year that is past was one of unusual interest and importance in a Cream Separator way. Twelve months ago we announced to cow owners the introduction of a complete new line of DE LAVAL farm and dairy sizes of machines, marking another great move forward in the development of the Cream Separator. The enthusiastic welcome given these improved machines by buyers everywhere exceeded even our great expectations and nearly carried us off our feet. Orders came so thick and fast that stock was soon exhausted and the DE LAVAL factory was forced to run day and night from March to July and continued with increased force on full time throughout the entire year. Notwithstanding the universal business depression DE LAVAL sales for 1908 were over 50 per cent. greater than in 1907. The new machines simply swept the field of all separator honors and made the year a notable one in separator history. Practical experience in the actual sale and use of 100,000 of the new machines has but served to suggest still greater refinement of perfection and to enable us to offer in the DE LAVAL for 1909 a machine that those who know say IS MILES AND YEARS IN THE LEAD OF EVERYTHING ELSE IN A SEPARATOR WAY. If you have not seen and used an IMPROVED DE LAVAL you really cannot know what a Cream Separator is today. It's surely in your own interest to do so before thinking of buying any other. Why not write at once for catalogue and full information, to be had for the asking.

PERMANENT EXPOSITION.

A movement is on foot to secure an appropriation from the State Legislature now in session for the erection of a permanent exposition building on the grounds of the Sixth District Agricultural Fair Association building, or, rather, land which was formerly owned by the association within the city of Los Angeles. This land, at one time in the outskirts of the city, has become through the growth of the city, one of the most central properties and it has increased in value wonderfully. It became a most attractive property to the directors of the former association when it ceased to be used as a fair grounds. The matter was taken into the courts and it was ruled it was still the propery of the state and not of individual stockholders. The effort now is to have erected by the state on these grounds this exposition building which shall be permanently maintained as a place of displaying "Made-in-California Products."

The matter was presented at the recent State Fruit Growers' convention at Sacramento and received a unanimous endorsement. Counties in the northern part of the state have for several years found advantage in maintaining permanent exhibits in the city of Los Angeles, as it is a gathering place for tourists coming to California. But the expense connected with renting store rooms at all centrally located has been so great that it has been a burden upon every county that has maintained such an exhibit. If such a building were erected at state expense with the understanding that every county exhibitor is to have free space and the grounds and building made attractive enough that tourists would go there to secure in a short space of time an idea of California and her productions, it would prove for the counties more profitable and at the same time much less expensive than the present plan of each county renting high-priced property along the business streets.

We trust the movement will have the support of legislators and believe it will have profit in it for the producing classes of the state.

PROTECT OUR FRUITS.

Outside of the question of tariff for revenue or for protection as a political issue, there is the question of protection for our fruits and farm products, as long as protection is in vogue, which demands earnest consideration from our producers. Attention may be called to clippings which appear this week in the citrus department of this paper regarding importations of an American orange grower who is raising oranges in Mexico, in which he is quoted as saying that he hopes "Mexican fruit growers will be kindly dealt with by the revision committee." Of course California has in Washington her lobby working for the retention or increase if possible of the tariff on fruits, but we must bear in mind that importers and foreign producers are also alive to the situation and are leaving no stone unturned in order to secure free trade or at least reduction on those things which they wish to import. In addition to that the eastern manufacturer is willing to trade off the farming interests so that he may secure the retention of high tariff on his manufactured products. Only a few weeks ago this page called attention to the fact that the shoe manufacturers were working to secure free trade on hides, and of course a high protective tariff on shoes. Consistency is what the farmer demands and must insist upon if he would hold his products on an equality with those of the large manufacturing interests of the east.

As to Mr. Taft's position in this matter, we quote the following from a recent speech:

"My principle in regard to the duty to be imposed on products of the United States is that the American growers should be given the protective duty which will put them on an equality with foreign growers; that is, a duty equal to the difference in the cost of production at the point of delivery between this country and abroad, and if the present duty does not exceed that, it should be retained in the tariff law. Of course, I have no knowledge at all as to the cost in respect to fruit, but I am clear as to the application of the principle."

LABOR.

As a rule the warmest discussion before the sessions of the Country Life Commission showing the most diverse opinions was the question of labor. Some appealed for the removal of restrictions of Chinese immigration. None or at least but very few wished for any further Jap invasion. The Jap as a farm laborer has almost invariably been found tricky and treacherous and any thing but an honest laborer for his employer. Very often "the blanket man" was condemmed as equally unreliable as the Jap. This brought from Mr. Keppel, Superintendent of Los Angeles County Schools, the statement that at one time in his life he had gone from ranch to ranch, his blanket on his back, looking for work. When secured he had been invariably given permission to sleep in the shed, never being admitted to the home and the only place which seemed to be open to welcome him was the American saloon "the most damning concern on the American continent today."

What California wants is a class of labor which will increase the attractiveness of country life. This will never be done by the introduction of Oriental labor. An item was made on the opposite page of this paper a few weeks ago that in a certain community a census of its laborers had been taken which developed the fact that there were in that community 500 Japanese laborers and 75 white laborers. Would a home seeker coming to California seek such a neighborhood for the education of his children? Still more will a resident now living there remain if within his power to escape? White and Oriental labor will never mix and it will be impossible for the Commission to make a recommendation too strong in which opposition is expressed to the introduction of Oriental labor as a means of creating better rural conditions.

CAN'T CO-OPERATE.

It is very unfortunate that the cantaloupe growers of the Imperial valley are unable to get together and form a thorough going business like organization which would handle the products of those rich acres in a way which would bring some returns to the growers as well as to the middle men and railroads. Southern California can show the most perfect co-operative fruit marketing organization which any section of the world can produce, but with that example as a possible guide, the great majority of our producers seem to prefer to fight their own way alone very much as the small boy in the meadow fights the bumble bees which aare buzzing about his closed eyes.

The lesson to the cantaloupe growers of last year should have been sufficient to have opened the eyes of the grower to the needs of the hour and secured a co-operative effort which would have placed the coming year's fruit in the market at a profit. But rather than do this, the majority of the growers have decided to each go it alone and the result of the coming crop's returns is purely guess work. If enough have been discouraged so that there will be a very limited output it is possible fair prices may prevail. Sure it is the production will not be so great as last year.

LEGISLATION FOR PURE INSECTICIDES.

A bill now before Congress, introduced in fact at the last session, provides for "preventing the manufacture, sale and transportation of adulterated or misbranded fungicides, Paris Green, lead arsenates, and other insecticides, and for regulating the traffic therein." This bill has the support of several Eastern state apple growers associations, the Apple Growers Congress, the National Grange, many pomological societies, as well as the largest chemical manufacturers of the country.

This is a needed regulation and will, we trust, secure sufficient support in the present Congress to insure its passing. Every apple grower who has had occasion to use either Paris Green, or lead arsenates, knows the unreliable nature of these products. The enactment of such a law would protect both the grower and the honest manufacturer.

CORRECTION.

The Cultivator regrets making an error in the crediting of the authorship of the article on first page of last week's Cultivator to Prof. G. W. Shaw. It should have been given to A. J. Gaumnitz, who is working with Prof. Shaw. In fact, Mr. Gaumnitz has direct charge of the field work at the University Farm at Davis and is doing some excellent work which is proving of great value to grain growers of this state. The Cultivator has in hand an article written by Prof. Shaw at the same time as that of Mr. Gaumnitz on the "Possibilities of Plant Improvement in California," liberal quotations from which will be made in a later Cultivator.

Shop Talk

BOOK ON ALFALFA.—A review of this book in the Cultivator of December 10 resulted in a very large demand for it through this office, and to those who possibly overlooked the offer before, we again mention it. It is certainly a valuable book for any interested in that crop and is written by F. D. Coburn, now secretary of the Kansas Department of Agriculture. The price of the book is regularly $2.00, but for $2.50 we are ordering the book mailed postpaid and giving a year's subscription to the Cultivator as well. It is well worth the investment.

A pleased reader in Galt recently expressed his appreciation of the Cultivator in these words: "I consider the Cultivator to be worth many times its price. In fact, I often find a single copy to be worth more than the price of one year's subscription." Such expressions are an incentive to continued effort in making our paper valuable to every rancher who sees it.

Agricultural News Notes of the Pacific Coast

Northern California

The attendance at the Agricultural High School is larger than anticipated.

Many settlers are arriving at Orland attracted by the big government irrigation scheme.

A. M. Cleghorn has been appointed instructor of English in the School of Agriculture at Davis.

A joint meeting of Shasta and Tehama land owners has been held to consider irrigation matters.

Cloverdale, in Sonoma county, is making preparations for its citrus fair, which will be held in February.

One company of Nevada county has 200 Greeks cutting ice for storage. The ice there is 12 inches thick.

Vast numbers of spruce and fir trees were taken from the mountains in Nevada county for Christmas trees.

Four thousand Tehama county sheep, making 24 carloads, were recently dipped and shipped to the Miller Lux ranch, near Stockton.

Chico has a stock of last year's hay held over for the big price of this year. Many dealers maintain that hay prices will soon be lower.

Yolo county people are moving to secure the enactment of an appropriation for a state highway to connect that section with Sacramento.

A reclammation project largely in Sacramento county is under way contemplating the saving of 55,000 acres of land which at present is practically worthless.

The plant introduction garden at Chino recently received ten carloads of bamboo from Japan, which after being established and acclimatized will be distributed.

The mountains in Northern California are heavily covered with snow, it being reported that in the streets of Quincy, Plumas county, there was nine feet of snow after a recent storm.

Grape growers of Sonoma county have decided it is wise to separate their fight from the saloon fight if they are to win recognition in the present campaign for consumption of the California wines.

Anderson Valley in Shasta county has been troubled with loss of much stock by the depredations of a large panther, which was finally captured. The beast measured ten feet eight inches from tip to tip.

The Grape Growers' Association of California has sent out a four-page circular urging the grape growers of the State to co-operate in every way possible to secure relief from the ruinous prices which prevailed during the past year.

During 1908 the part of the state north of Tehachapi shipped of apricots 231 cars, cherries 208 cars, grapes 3816 cars, peaches 1980 cars, pears 2701 cars, plums 1763 cars, other fruits 2116 cars. The latter item includes apples. This makes a total of 12,917 cars of green deciduous fruit from Northern and Central California.

A Christmas turkey being dressed by a woman at Oroville proved to be a decidedly rich bird, for from its crop the woman secured one sapphire weighing two carats and one small gold nugget worth about one dollar. The turkey had been fed in the Dry Creek section, from which something like 200 diamonds have been secured.

Central California

A Watsonville boy has a thirty pound turkey which is one year old.

Santa Cruz county has about 900,000 bearing fruit trees and 100,000 non-bearing.

A most interesting farmers' institute was held at Monterey on the last days of the old year.

Alfalfa hay in the San Joaquin valley has given but very scant growth during the recent cold weather.

The report of the State Agricultural Society is issued and gives a very good idea of the agricultural resources of the state.

A big fight is scheduled before the National Congress this session between the city of San Francisco and other interests in the waters of the Hetch-Hetchy.

The Sempervirens Club of San Jose asked for state aid in better protecting the California Redwood Park, located in Santa Clara and Monterey counties.

At a recent meeting of the San Jose Grange it was reported that black scale is being very materially reduced by a parasite which it is said has not yet been named.

The institute of farmers at Clovis, Fresno county, passed resolutions favoring Parcels Post "equal to that of other civilized nations" also favoring good roads for Fresno county.

A new and patented process of evaporating vegetables has been perfected by Hanford parties which is proving very successful and is thought to promise an outlet for many California vegetables now wasted.

The Agricultural Special which made a recent trip through the San Joaquin valley was well received and a world of information secured by farmers along the line of the Southern Pacific which conducted the train.

The annual meeting of the stock holders of the Kings County Fair Association recently elected the following directors for the coming year: A. F. Nunes, A. C. Borgess, J. D. Biddle, M. P. Costa, M. P. Avilla and J. O. Hickman.

In appealing for the continuance of the present freight rate before the traffic manager, Walter M. Field of the Canners' League maintained that if the increase in freight rates was persisted in, many of the smaller canners would be ruined.

The board of supervisors in Fresno county had a warm time in electing a horticultural commissioner at a recent session. Messrs. McIntosh and Schell were the candidates. Mr. McIntosh maintains that a "Schell" game has been worked on him .

The management of the Tulare County Citrus Fair has decided that the next fair shall be held at Dinuba. Dinuba is not so strong on citrus production as some other sections of Tulare county, but she has taken a hearty interest in the fair and made a fine display at the Exeter exhibit.

Orange trees in Kern county especially near Bakersfield were severely injured by the recent cold weather. In that section it was the coldest in the history of the county. In the city of Bakersfield at noontime of the coldest day the thermometer registered 30 degrees which was the highest of the day.

Southern California

Calexico is taking steps to hold a farmers' institute.

Holtville is taking steps to secure the erection of a sugar factory.

One farmer at Calexico reports $2400 return from a forty acre alfalfa field.

A large acreage of apples will be planted near Oro Grande, San Bernardino county.

Redlands shipped 151 cars of holiday fruit this season as against 231 last season.

Beet growers are looking with some concern on the efforts made to reduce the tariff on sugar.

The Santa Ana Valley Irrigation Company is discussing the advisability of increasing its capital stock.

The Coachella Valley output of melons it is estimated will be about 50 per cent that of last year.

Capital has been secured and arrangements are being made for a meat packing house at Calexico.

Santa Ana is having trouble with its sewer farm, as property owners do not wish its location near them.

There will be a great increase in the quantity of grapes shipped out of Imperial valley the coming season.

Shipments of live stock from the Imperial Valley by one train last week carried out $9000 worth of hogs.

The California Vegetable Union, with offices in Los Angeles, ships annually about 3500 carloads of vegetables.

The re-survey of the Imperial valley went into force in nearly all of the townships of Imperial valley on January first.

The increasing price of celery looks exceedingly good to the Orange county celery growers. About 125 cars a week are being moved.

Mound, Ventura county, has a most active and helpful farmers' club. At its meeting last week it was addressed by Professor Cook of Pomona.

Many cattle being shipped for slaughter out of San Luis Obispo county are now compelled to be dipped because of being infected with Texas fever tick.

The Oxnard Sugar Company entertains its employees and beet growers at a barbecue at the factory this week. It is estimated at least a thousand beet growers will be present.

The Antelope Valley, especially at Lancaster, was covered with a mantle of snow during the recent rain. It is estimated that no less than nine inches covered the ground at Palmdale.

The Imperial and Coachella melon growers shipped last year 631 cars of melons to central states east of the Rocky Mountains, 395 to other western points and 896 cars to Atlantic coast points.

The Oxnard Sugar Company is preparing to run a branch railway for the purpose of carrying beets from several ranches east of Oxnard. This road will increase the acreage planted to beets about 800 acres.

The American Nile Cotton Company has been incorporated in Imperial county with $25,000 capital, and the following elected directors for the next year: W. F. Holt, D. R. Crawford, George A. Carter, J. R. Loftus, and M. L. Pellet.

Recent floods in the Colorado river have done no damage to the big Laguna dam.

Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards. and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

S. E. Gregg East Adams St. Riverside, Cal.

White Wyandottes

My San Jose Winnings: 1st, 2nd and 3rd Cock; 1st Cockerel; 1st, 2nd and 3rd Hen; 1st and 2nd Pullet. The above winnings were made out of ten entries.

Box 60, R. No. 1 Mrs. C. D. Hubbard San Fernando, Cal.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

SOUTHERN CALIFORNIA SHOW.

The Poultry Breeders' Association of Southern California has just held a very successful show at Chutes Park, Los Angeles, lasting from Dec. 31st, 1908, to Jan. 6th, 1909, and being the fourth annual exhibit held under the auspices of this association.

The officers in charge are R. L. Walton, Tropico, president; C. M. Walton, Glendale, first vice-president; E. E. E. Merson, Los Angeles, second vice-president; S. E. Salisbury, Monrovia, secretary; J. L. Harrison, Pasadena, treasurer. The judges are S. Tyler, Pasadena; H. W. Gunston, South Pasadena, and G. W. Masterson, Duarte.

There were 1029 birds entered, a few less than for 1907, but for a "hard times year" a very satisfactory showing, while the association congratulates itself and the breeders generally upon the greater merit and higher quality of this year's birds.

All varieties were well represented, from the lordly Brahma to the tiny bantam, and all seemed in "high feather" and excellent health, proclaiming California's climate agrees with chickens as well as humans.

The blacks seem to suffer less from the effects of the strong sunshine than any other color, and were majestic with rich green sheen, and mostly free from the purple tinge which makes black so difficult to hold, in perfection. Some of the whites would have been the better for a bath, others were immaculate and snowy. The Buffs showed the effects of the sunshine by shafting in many cages, as did most of the Reds, but as a whole the show compared very favorably with many eastern exhibits.

Some specimens were of immense size, one light Brahma cock in particular, whose head reached nearly to the shoulder of my nine-year-old daughter, with whom he was photographed, weighing 14 pounds.

Two other light Brahmas weighed 12 pounds each, and would have delighted the heart of "Uncle Ike" Felch if he could have seen them. One Black Orpington also weighed 12 pounds, and was a beauty.

There were eighteen classes of standard fowls and twenty varieties of Bantams represented. White Rocks led in the standard class, with 164 entries. White Leghorns came next with 124 birds, double the number shown last year, and testifying to the increased interest taken in Southern California in this utility breed. Wyandottes numbered 119, and R. I. Reds followed with 115. There were 82 Orpingtons on exhibition, Blacks, Buffs, Jubilees and Whites, and 42 Minorcas.

There were a few of the newer and scarcer breeds, one pair of Black Ravens shown by the originator, G. Irwin Royce, and trio of Buckeyes, dark red and gamy, shown by the originator, Mrs. Frank Metcalf, who also exhibited a trio of her latest love, "California Cardinals," little, dark red beauties. Dr. Winslow of Monrovia had two pairs of his R. I. Red Bantams on exhibition, and very handsome little fellows they were. I understand the genial doctor is the originator of these pretty birds, for which he is to be congratulated. G. Irwin Royce, president of the Bantam Club, and originator of the popular Bluettes, showed a decided novelty in a pair of Red, White and Blue Bantams, built along approved laying lines, and with pleasing plumage, nicely blended naturally, not colored artificially, as some might suppose.

People are looking more and more to utility poultry, and a fine exhibit of fourteen display pens, consisting of one cock and eight hens each, in seven varieties, bore testimony to the success of their efforts along this line.

A notable display of ducks consisted of two pens of White Indian Runners, a new variety, combining the shape of the Runner and the plumage of the Pekin. A pen of Buff Orpington ducks also attracted much attention, and one pen of Pekins, an old, tried and true variety, was shown.

Thanks are due to C. M. Walton for courtesy in giving the above figures, and whose valuable time was encroached upon mercilessly in our search for facts.

The fourth annual exhibition of the Poultry Breeders of Southern California has taught some valuable lessons. The old theory that fine feathers and utility qualities do not combine is exploded as one walks through these well-filled aisles where beautiful birds of every color vie with each other in proclaiming their practical worth. Their weight as well as the enviable egg records of some of them is surprising.

The judges found a difficult task confronting them, but Gunston's smiles when he reached the Red alley were good to see and he professed himself well satisfied with the quality of the birds, by which all who know Gunston will realize that the under color was O. K. The surface spoke for itself and a finer class of R. I. Reds would be hard to find. The Buffs, especially Wyandottes, were that even clear buff, so difficult to obtain and the fifteen birds ranked very high.

White Rocks and Dottes were both strong although some dissatisfaction about awards was found as is always the case in such a large class. A pen of the new Columbian Plymouth Rock was quite a novelty but did not compare with the older Columbian Wyandottes, although when bred as long they will likely do so.

Buff Rocks were a good class and the winning cock was simply grand. Barred Rocks showed up well as to quaity, but were not a large class. The difficulty of getting really good show birds in this grand old utility breed is becoming greater every year as the exactions of the standard are increased. Cornish fowls are not backward about coming forward and the quality of those shown was of the very best and with better combs than is usually found on this breed.

Two tireless brooders were placed upon exhibition and were very interesting and well worth the price of admission as any one at all handy with tools could go home and construct one. The Philo appears to the writer as be-

ing for the most practical. But a good hen is the best ever.

There is no better place to visit than a poultry show, and a day spent among fanciers will convince the most skeptical that there is a fraternal feeling among chicken cranks which makes them all akin, and the magical word, "Poultry" levels all class distinctions and doctor, lawyer, millionaire and mechanic mingle with but a single thought, and that thought is Poultry. Better poultry and more of it—that is the slogan. Without poultry shows fine breeding would soon become a lost art and instead of the beautiful plumage and distinct types we now see, all would degenerate into a mongrel mixup, with neither beauty nor utility to commend them.

The public should support these shows well by their attendance and the valuable lessons learned will never be forgotten.—Mrs. Metcalf.

PIGEON POINTERS.

Fresh water should be given twice daily.

Buy only the best of grain; avoid damaged stuff.

Do not forget that profit can be derived only from mated pairs.

In order that it may easily be taken out and cleaned; the floor of each nest box should be movable.

Sawdust should not be used in the nest, as it harbors lice.

Never add new birds to a flock already started, if you possibly can help it.

After seven or eight years' breeding, the usefulness of the bird is ended.

Between the ages of three and five years, the pigeons are in their prime.

For want of proper experience, the first year the parent stock are apt to be more or less careless and neglectful. After giving the feed, it is best to leave the loft, as pigeons are apt to forget their young if watched while they are feeding.

It is estimated that a pigeon of the average size will need an ounce of food a day, together with plenty of grit, salt, and fresh water.

Where a loss of appetite and indisposition of the bird is noticed, a good remedy is to feed a little hempseed, add precipatated chalk to the drinking water, and keep a good supply of grit and salt-cat within reach. It will greatly help if the bird is isolated for a day or two.

Squabs can not see until about eight days old.

A good weight for dressed squabs is eight pounds to the dozen.

The eggs hatch on the eighteenth day of incubation.

In stocking the loft, allow two nests for each pair of breeders.

As a rule, the breeding season extends from March to September.

The first egg is generally laid about two weeks after the nest is made.

While the house must be dry and warm, it is not advisable to add artificial heat, excepting in the case of very large structures.

The Homer is a strong, well-built bird, of good size, thrives in confinement, is an earnest breeder and a careful feeder.

The Runt is the largest of the pigeon family, but they are slow breeders.

Never feed new grain, as it is apt to cause bowel troubles.

Rye is a grain that should never be fed, as it is very laxative and liable to cause severe intestinal irritation and death.

Hempseed must never be fed liber-

The "Jubilee Year" of Page Fence

A Quarter-Century of Unparalleled Success

Page Fence is the Pioneer—the oldest woven wire fence on the market. Twenty-five years of test prove the supremacy of Page Woven Wire Fence in tensile strength, elasticity, durability and economy. Over 800,000 farmers, stockmen, dairymen and poultrymen use and praise it. The Government uses Page Fence as the highest standard of quality. The first Page Fence sold is still in service—never has needed repairs. The Page Fence we are selling today is vastly better. It is a genuine High-Carbon, Basic Open-Hearth, Steel Wire Fence. Money cannot buy better. Send for a free copy of the "Jubilee Edition" of the Page Catalog.

Coulson's Special Dry Chick Food

Makes Them Grow

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

ally, as it is very heating and fattening.

An overcrowded loft is both unprofitable and dangerous.

When the young birds are about two weeks old, the wing and tail feathers generally start growing. The small feathers follow these.

The old birds quit feeding their young as soon as they hatch out a new pair of squabs.

It is a mistake to build the house directly on the ground. Such lofts are usually damp, and besides are hard to keep rat proof.

There should be no cross-pieces in the middle of the fly, as birds are often injured by flying against them in a sudden flight.

The small, round louse, found on the head and body, is the most troublesome.

Before placing new stock in the loft, it should be quarantined for a week or so.—Petaluma Poultry Journal.

CHICKEN CHAT.

Turkey and Hen Died.

I have lost a turkey hen, a pullet and a young rooster. No two of these were sick at once, but they all acted the same. They begin by stretching up their necks and acting as if they had swallowed something that would not go down; that was the only symptom for several days, then they began to mope and act as if hungry, but unable to swallow. Examination showed nothing wrong with mouth or throat, and no lump in the crop except in the case of the turkey a few days before she died. I gave her sweet oil and rubbed the crop, but could do no good. Water ran out of their mouths when they bent their heads down to eat. They attempted to eat to the very last, yet seemed to starve to death. Another rooster is beginning to stretch his neck. The trouble has only appeared among those which are running out. They are fed on wheat and Egyptian corn, and have pure water. The droppings appear nearly natural—perhaps a trifle whiter than usual, and with a little green in them. The combs look red until nearly the last, when they get a little dark. They are sick about two weeks, the turkey longer than that.—Mrs. S., Pomona.

If your fowls had access to barley, I should think perhaps they might have barley beards choking them up somewhere, as their symptoms were exactly the same as those in a horse we had, which we thought had lockjaw for a few days, but by using plenty of linseed oil we saved her.

If there is any alkali land near you, the birds may have picked up chunks of that, which would cause these symptoms, as also would the deadly nightshade berries so common here.

Or, there may have been some unslaked lime around, which they got at. It must have been something they got while running out, if those kept in are not affected; some poisonous food, which should be looked after: if not barley.

* * *

Pigeons.

I bought 75 pairs of pigeons. Some are mated and some not. I am trying to coax them out to hunt their living, but it seems quite a task. They are Homers. Will they finally do so? Does it pay to raise squabs if one has to feed them entirely? I don't see how I can separate my pigeons—the mated from the unmated—if I let them fly out.—C. A. B., Chatsworth.

Pigeons will not forage for a living after having been fed, so it is useless to try to teach them to do so. Squabs are considered very profitable, and are less trouble than other fowls, for the old bird feeds the young entirely while in the nest, and squabs are marketed before they learn to fly at all.

Bees and Their Care

ing
he

BEE NOTES.

He will be willing to keep a few bees—yes, he would be very glad to do so if he could place a few colonies in his orchard without having to "everlasting swarm."

This difficulty may be very largely overcome.

Bees swarm primarily because of a lack of room. If, instead of using a single hive, we use one of double capacity, one on top of the other, the swarming tendency will be very materially curtailed.

I therefore advise the farmer and fruit grower to use hives of large size, or else use hives of ordinary size one piled on top of the other.

The bees and queen should be given unlimited room, and they should be run for extracted or chunk honey—not for honey in the little section boxes that one sees in stores.

It is assumed that the farmer fruit grower does not care for honey in sections. For his own family, this chunk honey stowed away in large stone crocks will suit his purpose quite as well as that stored in the small boxes seen in the groceries.

For that reason the honey should be stored in regular frames or "racks," as some call them, that hold the comb. It may then be taken off and stored in the crocks.

At the beginning of the season one story of a Langstroth hive will be enough. Just before fruit-bloom opens up, another story should be added, containing empty combs or frames of comb foundation. As the season advances another story should be added.

In the meantime a large unobstructed entrance should be provided at the bottom. If the bees cluster out in front they will be almost sure to swarm; so at all times there should be enough room provided so they can be kept inside of the hive and at work.

Colonies so manipulated may store for the fruit grower, from fruit bloom and clover, anywhere from 50 to 200 pounds of fine honey, which will be worth at the very lowest calculation, in the form of chunk honey, at the local groceries, not less than 10 cents per pound.

It goes to show, then, that in a fair season our fruit-grower farmer, to say nothing of the actual benefit of the bees in scattering pollen, may get anywhere from $5 to $20 per hive.

But if the latter figure is reached, the fruit grower must be willing to spend a little time on the bees—perhaps an hour to the hive for an ordinary season.

Some colonies handled in the manner explained may swarm; but as a general thing there will not be over five per cent of such swarms.

As a precaution in such cases, put over the entrance of each colony an Alley trap. This will allow the workers bees to pass out and in freely; but when the queen comes out with a swarm, she is trapped in a compartment, because she cannot go through the same slot through which the workers can pass.

While the swarm is in the air, the trap containing the queen is taken off, the old hive is removed from the stand from which the swarm came, and another (empty) is put in its place.

When we speak of an "empty" hive we mean one containing frames of foundation or combs.

The trap is then placed in front of the new hive now on the old stand. In fifteen or twenty minutes—possibly longer—the swarm in the air will return and go into the new hive, hiving itself automatically.

The queen is released from the trap, when she will go into the swarm. The bees will then start housekeeping anew.

In the meantime there has been no climbing of trees, no pounding on tin pans, and no general interruption of farm work.

When the swarm comes out the farmer's wife or one of the children may make the substitution of hives as explained, leaving the farmer in the field to continue his work.

By modern methods it is not necessary that the farmer himself give very much attention to the bees. He can turn that all over to his wife or children and if he will let them have all the money they can make from them we may rest assured they will soon acquire the art of handling them and at the same time lay aside a nice little sum of money.

It should be stated in all fairness that there are some seasons when the bees will hardly make their own living.

Indeed, they may require to be fed sugar sirup in order to keep them from starving outright. But usually there is only one poor season out of four or five.

In the good years the bees will more than make up the cost expended on them several times over

The keeping of a few colonies—eight or ten—will give very much larger returns per hive than the keeping of a larger number.

FEEDING BEES.

If the bees are gathering little or no honey, feed a pint of sirup every other day to stimulate brood rearing. Bees reared about this time will constitute the colony that will winter best.

Look out for robber bees. Give the feed toward evening, after they have stopped flying.

In feeding use a two quart Mason jar, and punch a lot of small holes in the metal cap; or get the perforated caps from some supply house, and after putting the sirup in the jar screw the cap on.

Secure a board the size of the outside edges of the hive, and cut a round hole in the center, just large enough for the metal cap to set down in, and place it over the brood body of the hive. Place an empty hive body on, put the feed in, and place the lid of the hive over all.

See that no colonies are queenless at this season.

Give frames of hatching brood from the stronger to the weaker.

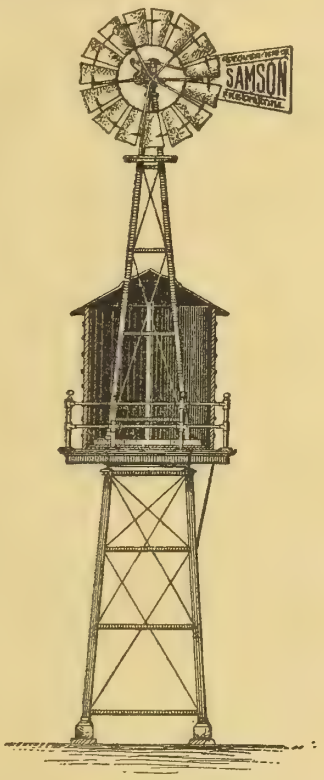
Make every colony strong, or else the bee-moths will destroy them.

To avoid the anger of bees, no method has ever been found that compares with the use of smoke. This evidently frightens them more than any other thing ever tried.

Since modern science has done so much to simplify the care and management of bees, there is no reason why every family living in the country should not keep a few colonies for its own use.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

SEEDS PLANTS TREES

Begin the New Year by planning your garden.

You will need some vegetable seeds; some flower seeds and some ornamental trees and fruit trees. We sell seeds of all kinds—by the 5 cent packet to a car load of Alfalfa .

C. C. Morse & Co. are by far the largest Seed House on the Pacific Coast and hold the very highest reputation for the best grown seeds of the best quality.

We will send our new catalogue for 1909 free to any one who sends us his name and address. This is a catalogue we are proud of and we hope that everyone on the Pacific Coast who is interested in the Garden will send for it. It is carefully written and gives complete descriptions and cultural directions. In it, we are offering several new and attractive vegetables and flowers and a great Rose Novelty from France. Our page on planting and caring for Roses is worth more than the trouble it takes to write for a catalogue. DON'T FAIL TO SEE IT.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Uusigned communications receive no attention.

Storage of Sweet Potatoes.

How can I keep sweet potatoes during the winter months here?—W. H., Sunland.

Any method that will keep the potatoes dry and at a temperature nearly uniform will succeed. And in well drained sandy loam I have kept them perfectly in the ground where they grew. For a small quantity, I have been very successful in keeping them in perfectly dry sand in the barn. But no method known to me will keep sweet potatoes over winter that have been carelessly or roughly handled. They are very susceptible to bruising, and while it may not show at once, it will be very apparent before spring. They should be dug before frost has killed the vines, and handled as carefully as you would handle eggs. Allow them at least a day in the sun to dry before putting them away. It is a disputed question among growers whether it pays to store for a higher price—many are of the opinion that the risk from decay more than equals any advance in price.—Q. A. L.

Ditch Manuring.

Under "Queries and Replies," on page 613 of December 24th issue, I notice the query on "Ditch Manuring." Perhaps the subscriber has reference to the spreading of manure in ditches. I have known some who open deep, wide furrows with single shovel, two furrows between each two rows. The wagons drive between the furrows and the manure is shoveled into the furrows or trenches instead of being spread on the surface. As fast as the trenches are filled the furrows are closed with a common cultivator on which are fastened at proper angle two boards two feet long in such a manner as to draw the dirt from sides of furrow back over the manure, covering it completely and immediately. I have observed this method in one grove in West Riverside, and understand it has been followed by others. The idea is, I think, to conserve the liquid manure by preventing evaporation from the surface, or finer particles from being blown away. It seems easier to cover the manure this way than by plowing it in when plowing would be otherwise unnecessary, as in fall or early winter.—D. E. Furrow, Riverside.

Mr. Furrow adds in a postscript that this custom, which has been followed by a few, has not received the endorsement of the citrus experiment station located at Riverside; in fact, the general preference in Riverside is to scatter broadcast during winter season, then plow under the same as green manuring, at springtime. Regarding Mr. Furrow's point of conserving, by covering the liquid manure, which if left on the surface would dry away, we tnink it is hardly well taken, because the evaporation of the liquid does not necessarily carry with it the salts which contain the fertilizing element. Of course, where fertilizer has been partially decayed and ammonia generated by this process, the escape of ammonia does cause loss of nitrogen. But manure containing the liquids of the stable taken directly from the stable have but little ammonia to be lost in this way. We thank Mr. Furrow for his statement of this system, and will be glad to hear from him again, or other subscribers as to their opinion on it.

Pruning.

How should apple and pear trees be pruned? My trees are two years old, with long, straight limbs. Should they be cut back? How can I tell the difference between a leaf and a fruit bud on peach, apricot and plum trees? Will Bordeaux mixture benefit grape vines?—E. H., Riverside.

We hope to give next week more explicit instructions regarding pruning of deciduous trees. In a word, at planting, the young trees should be cut back to say 30 inches. The first season's growth should be kept off that part of the stem which is close to the ground. The second year leave say three or four strong limbs so separated as to balance the tree well, cutting back to six or twelve inches. Cut to outside or inside buds according to habit of growth of tree and to your desire of growing an open or compact crop. The next year allow two or three laterals to each of these main branches and cut back at least half the preceding season's growth.

The leaf bud is not so large nor thick ordinarily as the fruiting bud. The terminal bud is usually—whether on main stem or spur—a fruiting bud.

Bordeaux mixture is used on vineyards to prevent spread of mildew, which affects the grapes when they start in the spring time. Many up-to-date vineyardists spray thoroughly in winter and then sulphur at blossoming time and later to prevent the spread of this pest of the vineyards.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Pruning.

Please give hints on pruning and planting of young trees. I am well pleased with your paper.—I. T. S., Fortuna.

Your query will be given answer in deciduous department of next week's paper.

Fig Cuttings.

I notice in your paper of December 17 an article on fig culture, stating that valuable specimens of cuttings would be distributed. I would be glad to know where I can apply for the cuttings.—D. B., Hanford.

The particular charge of these cuttings to which you refer is in the hands of Mr. Rixford, who is under the direction of Prof. Walter T. Swingle of the Bureau of Plant Industry, Department of Agriculture. It is possible they might be secured by addressing Mr. Rixford, who lives in San Francisco, but we think the better way and possibly the quicker would be to write to the Bureau of Plant Industry, Department of Agriculture, Washington, D. C. To secure these cuttings you must agree to plant and care for seedling figs, which will also be supplied to you by the department.

Insect Eating Leaf.

Please inform me through the Cultivator what insect attacked the enclosed orange leaves.—G. O., Ontario.

The leaves enclosed have been attacked by some mandibulate insect and the edges of all and almost all of one entire leaf have been eaten. It is an injury such as might have been given by the cut worm or some other similar eating insect. To say what insect it was would of course be utterly impossible. If our subscriber will secure the insect and send in to this office we will identify and give information.

Seedling Lemons.

Is anything known positively about seedling lemons as a stock for budding citrus trees? The opinion is common that they are liable to gum disease. I have observed that they are quicker and stronger than either the sweet or the grapefruit seedling.—D. E. F., Riverside.

We think the opinion that the lemon stock is susceptible to gummosis is correct. At any rate, we know it has been tried for many years, and the sweet seedling or sometimes the sour orange seedling or the pomelo stock is considered the best. The vast majority of our trees are on the sweet seedling root. You say truly the lemon root gives a strong growing healthy looking tree, but one very susceptible to disease.

Phosphoric Acid for Citrus Trees.

The soil in my citrus orchard is deficient in phosphoric acid and lime and I have been advised to use high

grade 18 to 20 per cent phosphate fertilizer, preferably the Thomas phosphate as it contains a great deal of lime. Is the Thomas phosphate as quickly available as superphosphate, both being the same grade, and how much lime do I lose by using the latter?—J. A. W., Escondido.

If your soil is the red or iron soil, the Thomas phosphate would be best, while the acid treated phosphate would be preferable in case of the darker colored soils. As a rule, the superphosphate or that which has been treated with the acid is preferred, at least where it has the same percentage of phosphoric acid as the other. It is, of course more quickly available.

Lime Application.

Is sugar factory lime good to apply to soils? Is air slaked better? I notice in a recent Cultivator that unslaked lime is preferable. Is gypsum to be preferred in any case? When I irrigate, if the ground is not immediately cultivated, very often it becomes lumpy and before the season is over forms a crust of three or four inches just below the cultivated mulch. Have had a cover crop for three years.—D. P., Covina.

The sugar factory lime has been applied to soils with most excellent results and from your description we believe it would make a good application on your soil. Plainly the need of humus is there notwithstanding your green fertilizing, and we think that should be continued and an effort be made to secure as heavy a crop to plow under as possible. This, with the application of lime, will tend to make your soil lighter and more easily handled. The factor in favor of sugar factory lime is that it is much cheaper than the air slaked or the hydrated lime about which the paper recently spoke. We do not think there would be any material gain in using gypsum in preference to lime and the gypsum would be very much more expensive. We hope to be able to give more complete answer as to comparison of the different limes and gypsum in a later issue.

Budding Cloth.

Please give me formula for making waxed budding cloth. Also can you give me the latest method of budding old trees?—A. E. R., Rialto.

Resin, 6 lbs.; beeswax, 2 lbs.; linseed oil, 1 pint. Break the resin into small pieces, cut up the beeswax and place the two together in a suitable iron pot. Pour the linseed oil over them. Set the pot over a slow fire and allow the materials to melt. For waxed cloth, saturate thin muslin with the wax. Prepare the cloth by tearing it into strips four or five inches wide and winding it around sticks about a foot or so in length and one inch thick. The rolls should not be more than two inches thick, else the wax will not penetrate to the center. Melt the wax over a slow fire, place the rolls in it and allow to remain there until the wax has penetrated the cloth. The wax should not be allowed to become too hot, else there is danger of burning the cloth. Have it just hot enough to keep the wax in a melted condition. As soon as it is saturated, remove the cloth from the wax and store away. When required for use, unroll the desired length and tear it into strips one-half to three-quarters of an inch wide. Some people, instead of cutting the cloth into strips, stretch out the cloth and apply the hot wax to its surface with a brush.

Some prefer to cut back an old tree in the springtime quite severely so that it sends out new shoots all around the head of the trunk or limbs at the point of cutting off. These strong young shoots are allowed to grow until, say, September or the first of October, when they are budded just as a young tree would be in nursery rows. Others prefer to insert the bud in the old bark at points where it is desirable to have the new branches start. These buds are less liable to take than the other, but if they do, make a very successful union, and time is gained over the former process. This budding is almost invariably done in the spring. Budding in the old bark is seldom successfully done at the fall budding.

Los Angeles, Cal., January 1, 1909.

GREETING AND ANNOUNCEMENT.

After more than twenty years of serving the dairy and creamery men of Los Angeles and Southern California, it gives great pleasure to the undersigned to extend to our friends of all these years, heartiest and most earnest of good wishes for a prosperous and happy year.

Beginning when California had only a small fraction of its present inhabitants and when the industries of dairying and of creamery work of the state were almost in their infancy, we have seen a wonderful growth. In this growth we have taken most satisfaction and no little pride in the part which we have been permitted to take in it.

It is with no little satisfaction that we now announce that we begin the new year in new and enlarged quarters, four fine store rooms, with magnificent equipment for doing a better year's work than ever.

Our old quarters at 555-557 South Los Angeles street have long been too small. New quarters with skylights for perfect lighting, abundance of room for everything, have been constructed especially for us at 225-227-229-231 East Sixth street, near Main street.

Above all we have room and a welcome for every dairyman and creamery man in California.

Come in and shake.

Yours for better dairies, better creameries, better products and better times.

O. J. WEBER COMPANY.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT. GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

AUTOBEE.

Beside a garage grew a rose,
Wind-tossed, with stem atilt;
One night unseen
Some gasoline
Onto this rose was spilt.

Adulterated flower juice
A bee did sip next morn;
And now he does
No longer buzz,
But honks just like a horn.
—F. P. Pitzer, in Harper's Weekly.

THE RING.

"I SAW you making eyes at the city chap," growled Bert Linwood. "I tell you, Betty, I ain't going to have my wife flirting with a lot of dudes who are only laughing at her."

"I'm not your wife yet," snapped Bett "and I'm never going to be. I bowed to Mr. Mines, but I didn't make eyes at him."

" You did so," insisted Bert. "I saw you. You don't have to grin like that every time you bow."

Betty's eyes began to fill with tears. She loved Bert; she had loved him for years, but this new unreasoning jealousy was spoiling her life. She drew off the ring and handed it to him.

"You'd better take that," she said. "You might use it in Turkey. Men lock their wives up over there. That's the sort of place you want to live in."

"I don't want the ring," he demurred. "I just want you to behave yourself."

"I guess I can't behave the way you want me to," she said. "You don't want me to be civil to any other man. Look how you wanted to thrash the clown at the circus last month just because he pretended to admire me. He was only joking, but you declared I must have given him encouragement. I was just laughing at him because he was funny."

"I didn't see where he was funny," snapped Bert, still smarting at the recollection of the cleverness with which the clown had turned his objections into comedy. "If you feel that way about it I guess I might as well take the old ring."

He tucked it into his vest pocket and, with an elaborate assumption of indifference, sauntered away.

Betty sought a quiet corner and sat down for a good cry.

It was always like this, Bert's unreasonable jealously spoiled every merry-making, but she had hoped that the Sunday school picnic might pass off pleasantly. It was at Canoe portage the year before that Bert had proposed, and she wanted the anniversary to be as happy a day.

Had it not been for Martha Spriggs, Betty would have enjoyed her cry in solitude, but that energetic spinster seemed to scent trouble, and she shortly appeared upon the scene. Bit by bit she drew the story from Betty and adminstered comfort. Then she bustled about the boat.

Most of the excursionists belonged to the same church. The rest were old friends, and before the steamer came in sight of Portage Island landing everyone knew of the trouble.

Bert was sensible of a change in the attitude of the crowd, but he pretended indifference and told himself that "if that little cry baby wanted to tell her troubles he was well rid of her."

After landing he stood on the dock watching the steamer continue on her way down to the end of the lake, and then strolled over to the grove where most of the shady spots under the trees were occupied by the basket parties.

The clean white tablecloths covered with a display of eatables tempting both in appearance and odor reminded him that Betty had packed a basket for the two of them, but Betty was sitting with Martha Spriggs and her crowd, and appeared to be blissfully ignorant of his fate.

He strolled about in the hope that someone might invite him to sit down and have a bite with them. As a rule, a dozen invitations would have been hurled at him upon his appearance, but now all seemed engrossed with their own parties, and though he went the whole length of the grove none asked him to share the feast.

Bert went miserably back to the dock. Here at least he did not have to look at Betty and the city chap (who was Martha Spriggs' nephew) chatting gaily over a bountiful lunch. It was the final touch of misery.

The island was state land well out in the lake. It was deserted except when picnic parties came, and there was no chance of obtaining food, neither were there small boats by the aid of which he might gain the mainland.

He had breakfasted early on account of the picnic, and now he was downright hungry. He would not give Miss Spriggs the satisfaction of knowing that he had been forced to ask for food, as he could see clearly that it was she who had put the entire excursion party up to ignoring his famished condition.

But pride is a poor substitute for provender, and the sight of the 200 or 300 picnickers all eating was more than he could stand.

He sought out the little place where he and Betty had lunched the year before. It was a little cove well sheltered from the rest of the shore, and there he lay down under the shade and sought to take a nap.

Even sleep appeared to have deserted him. He tossed restlessly about on the grass, but no sleep came and he was just about to return to the grove when a light footfall arrested his attention.

He lay back on the grass in the hope that his presence might pass unnoticed, but whoever it was was coming straight toward his retreat and presently he heard his name spoken and looked up to encounter Betty's pitying gaze.

"It was a mean trick," she said, penitently, "but I could not help myself. Anyhow, I kept two sandwiches for you, Bert. I'm sorry that there is not more, but it was all I could do to hide these. Miss Spriggs would never forgive me if she knew I brought them. I saw you going across the grove, and knew where to find you."

"You're a darling," said Bert as he bit hungrily into the bread and meat "That old maid would not have cared if I had starved to death."

"I guess it wasn't as bad as that," laughed Betty, "but I didn't want to see you go hungry. I must hurry back now, or they will find out."

"Don't go yet," he pleaded. "I've a whole lot to say to you."

"But they will be looking for me," she pleaded, "and I promised. I can't stop, Bert."

Pioneer Rubber Sanded Roofing

The Roof that "proves," sun-proof and rain-proof; needs no paint or repairs. Following are a few "Wont's" about Rubber Sanded Roofing:

Won't chip. Won't warp.
Won't tear. Won't crack.
Won't rust. Won't decay.
Won't shrink.
Won't crumble.
Won't need repairing.
Won't absorb moisture.
Won't attract electricity.
Won't need any paint to preserve it.
Won't be affected by any climatic changes or conditions.
Won't cost as much, in the long run, as other roofing.

What Rubber Sanded WILL do is told of in our booklet "ROOF TALK," which will be sent free upon request, together with samples of the Roofing itself.

C. Ridderhof, Laughlin Bldg., Los Angeles

When writing advertisers, mention Cultivator.

"Yes, you can," he declared as he laid a detaining hand upon her wrist. "You can stop, and you're going to. It will be all right when you go back, for you can tell old Miss Spriggs that her cure worked."

"What do you mean?" she asked wonderingly. "Miss Martha spoke of no cure."

"But she was working one," he explained. "She says the way to a man's heart is through his stomach, and she's trying it on me. But it ain't that," he said fiercely, "it's because I realize what a fool I've been. I want you to forget all that I said about young Mines and give me another chance. I ought to be glad that the girl I'm going to marry is such a favorite. I guess I am now."

Hope leaped into Betty's eyes, but she shrank back as Bert offered the ring.

"I'm afraid," she whispered. "You see, Bert, it's happened so many times, and it always spoils my pleasure because you get jealous when we get in a crowd. I don't care for anyone but you, but a girl has got to be pleasant to people she knows, and you won't realize that."

"I do now," he said soberly. "Like the people you read about in the [illegible] I've been fasting and meditating. It's been good for me, too. Won't you take the ring and give me another try, Betty? I'm cured this time, and if I ever do start to kick you yell 'Lunch' at me and see me curl up."

Three hours later they crossed the gangplank of the steamer homeward bound, and Martha Spriggs, on the upper deck, smiled softly to herself.

"Men ain't got no hearts," she told herself for the thousandth time. "They got stomach and brains, and most on 'em's got more stomach than brains."—Jacksonville Times.

Pretty Home-made Rugs

THERE are occasions when one desires some trifling yet useful occupation, and by devoting the idle hour to preparing material for pretty and serviceable rugs one can soon have enough balls for several of them and they can be knit or crocheted into rugs of any desired size. The crocheted rugs offer more varieties of forms than any other and they are very neat and durable. The pieces are cut into narrow, even strips as for carpet rags, then they are neatly sewed together and wound into balls. A pretty one is made by making a chain five inches long and working all around in single stitch, widening here and there to keep it flat, and any one who understands using the crochet hook can make one of these rugs, and one can use their own taste and ingenuity in arranging the colors.

A lovely crocheted rug, oval in form, was made entirely of woolen pieces and was shaded from pink in the center to garnet on the outside, and the faded and light colored woolen pieces were colored red with the diamond dye for wool, the different shades of the same color being produced by using the dyes in different strengths.

Perhaps the easiest way to make a rug is to cut the cloth in strips about three inches wide, then lay three or four of the strips together, lay them on a foundation made of some stout material and of the shape and size you want the rug to be. Stitch the first row through the center, and turn back, and stitch the next row as close to this as possible, and keep on in this way until the rug is finished. The strips can be cut into fine fringe as you sew each one on to the foundation, they can all be sewed on and then cut into fringe. This is a nice way to utilize old ribbons, as there can be nothing nicer than a soft rug of this kind for the bedside. If desired the colors may be arranged in a simple pattern, adding greatly to the beauty of the rug. Thesse homemade rugs are just as serviceable and help to beautify the home as much as the high priced ready made articles.—M. H.

Citrus Market

LOS ANGELES, Cal., Jan. 6, 1908

The orange market is much weaker owing to extreme weather over the East which lessens demand and makes impossible the best handling. About 85 or 90 cars per day are being forwarded. Some houses are opening but there is no likelihood of any material increase of shipments till the market strengthens.

Lemons are higher and the market is very firm. The imports will be affected by the disaster in Sicily and Italy and the cold weather in this state will reduce the spring crop so that the indication to hold is strong.

Shipments.

Total shipments since Nov. 1, 1908 oranges, 1958, lemons 675.

NEW YORK, Jan. 4.—Twenty-one cars navels, three cars lemons and three cars Arizona navels sold. The market is easier and considerably lower on all sizes and grades of navels. The lemon market is very strong and prices are higher. Weather mild, cloudy, muggy.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

SPINELESS CACTUS Experimental Culture

Specimen Plants To Be Sent Out

To secure an immediate widespread test of the value of the THORNLESS CACTUS as a Fodder Plant.

The Demand Will Exceed The Supply

Therefore if you are interested, don't waste your own and our time writing us. Send your Order and a Dollar at once. The published "Field Trial Reports" will be mailed free.

Only One Plant To A Person

And then only to those who agree to report the soil conditions, climate and results in pounds for the first years growth.

The Western Empire

Being ever alert to the best interests of its subscribers and readers and realizing the great value of this fodder in supporting a family cow on one-tenth the space required for alfalfa as demonstrated in this year's practical field trials and also the intense and national interest that the Luther Burbank Cactus Experiments have aroused and furthermore appreciating that this is no doubt the coming Fodder plant in many localities has secured the distribution of this season's supply of the hardy standard varieties, propogated and distributed by Mr. Burbank, with his prediction that they will yield 100 tons of Cattle and Poultry feed per acre.
This means enough fodder for the family cow on the rear end of a town lot.

These Plants Weigh an Average of One Pound

And cost: One Dollar each, express paid. Orders will be filled in the rotation received and until the stock is exhausted.

Each Order Will Include

A two years subscription to the Western Empire for the reason that we intend to collate and publish the actual results attained in all districts where this fodder cactus may be grown and in this way will keep all those fully informed who are assisting us in carrying on these experiments.

Cactus Application Blank

Editor Western Empire:
Times Building, Los Angeles, Cal., U. S. A.

I desire a specimen plant of Luther Burbank's Thornless Cactus of the hardy standard variety, successfully grown in the field trials last summer. I agree to make at least two reports to you on blanks to be provided with stamped envelopes. The yield of the same being for my own use at the end of the season for propogating purposes.

To cover the cost of the publicity, packing charges, prepayment of express charges, printed forms and copies of your paper for two years in which you are to report on the wide test from time to time I enclose One Dollar (Stamps —Money Order or Check.)

A Few Hints on Deciduous Pruning

The Trees Need Constant Care in Order to Have the Most Shapely Appearance and Power to Hold Big Crops Without Breaking or Being Ruined by Bending Limbs

SOME people go so far as to maintain that a deciduous tree properly grown should never be touched with pruning knife. "It is not Nature's way and Nature knows best how to meet her own requirements" is often asserted as a reason of the non-pruner. There is a certain degree of truth in that statement, but followed absolutely it would lead to Nature's way of producing fruit when she pleases. When man takes charge of an orchard it is to force the bearing capacity of the trees vastly beyond the way which Nature intended. This is not only true of plants and trees but of animal life as well. The productive power of our dairies left to Nature's way would mean the ruination of dairymen under modern conditions. The same is true to fully as great an extent in the orchard.

Of course there are some trees like the walnut, the fig and even the orange which require the minimum of pruning. But even such trees require most careful attention during their younger earlier years.

One point which should be more strongly impressed upon all planters is to give greater care to young trees by doing "thumb pruning" and take off more twigs with small knife. This would save the use of the saw and consequent serious wounds and sometimes ruined trees by taking off large limbs later. But unfortunately there are but very few orchards in this state which have had this earlier care.

It is entirely beyond the limits of this paper to give any explicit directions in the line of keeping up the young orchard or in correcting the mistakes of earlier care of orchards now in bearing. The best place to secure such complete information is in the field with an expert pruner or next to that to carefully read some of the books especially devoted to pruning. Probably one of the best of these books is Bailey's "Pruning Book." This is a $1.50 book which treats of pruning in all its phases and most thoroughly illustrates almost every feature of pruning work.

Owing to the many queries which are continually coming to the Cultivator, it may prove valuable to give a few general hints which may lead the pruner to more thoroughly investigate either by association with the expert or by close observation and reading. Bear in mind that this is more in the nature of hints and is in no sense a complete work nor even written with any expectation of any professional pruner reading it.

The Young Tree.

In planting the young trees, no matter what the variety, give clean cut ends to all roots which may have been bruised in taking up. This is too seldom done and owing to the fact that the work is covered from sight when the roots are under the ground, the grower seldom knows the real cause of lack of thrift which is sometimes indicated in young trees, which may be traced directly to this habit of burying mangled and broken roots, which are susceptible to fungous and other diseases. The ends should be clean cut. The best tool for this is a sharp knife which does not mangle the bark at all. The ordinary pruning shears if very sharp do very satisfactory work, but the knife is preferable. Some planters prefer a modification of the Stringfellow method. The Stringfellow method consists of reducing the entire tree to almost a cutting, that is, of removing very largely of the roots and nearly all of the top. Planters who have tried this differ as to their opinion, but we believe this extreme custom has attracted attention to the advisability of reducing both root system and top.

The writer of this well remembers his experience in planting a prune orchard many years ago. The owner had bought the trees with a great deal of satisfaction because of the exceptional strong growth they had made. They did have a magnificent root system and the trunks were as a rule an inch or more in diameter. After pruning the roots, trees were planted and after tamping the soil and following with irrigation water to give a further settling, an attendant was given a stick 16 inches long and told to place that beside each tree and clip off each top even with the top of the stick. That is every tree was topped exactly 16 inches from the ground. As many of these trees had been six and eight feet tall, this left the greater part of the tree lying on the ground beside it. This topping work was nearly done when the owner drove in to make inspection. Having but little experience with prune trees he was completely dumfounded at the fearful waste of cutting off these tops and gave immediate instructions to stop taking so much of the trunk off. The remainder were pruned according to his instructions, four or five feet tall. Of course he left the orchard in no amiable frame of mind because of the great waste in cutting back his trees. Within five years from that time the wisdom of the short topping was most conclusively proved in that orchard. The tall pruned trees had been affected by the wind to such an extent that they were leaning badly and many were already beginning to sunburn on the southwest side. The greater part of the orchard which had been pruned 16 inches high had shapely tops, perfectly upright, with a well balanced head, branching out some limbs even with the ground, others up as high as the 16 inches, which was the original height. These trees had the fruit nearer the ground, the wind had less purchase upon it and were magnificent prune trees. We regret very much that long life was not given to this orchard that it might have been proved, as we believe it would have, that the low pruned trees were far longer lived trees, for the sunburn already beginning to come on the trunks of the tall pruned trees would certainly weaken their vitality. A later owner, however, decided that oranges would be more profitable and the prunes were compelled to give way to oranges, as has been the case with many other fruits in the history of California planting.

First Year's Pruning.

During the first year the orchardist should watch his trees, and as the growth starts and the small branchlet indicates thrift, and is so located as to balance the tree, it should be encouraged, but where too many come out on one side or otherwise the twig denotes it will not be needed as a future foundation branch for the tree, it should be rubbed off. Here is where the pruner will save the use of saw in later years. Trees allowed to grow at will for the first two or three years grow such a crop of cross limbs and sometimes undesirable suckers that the mature tree ultimately becomes a mass of tangled wood massed together. We have seen such trees where to bring them into desirable shape a half or more of the top had to be removed. This great waste is not necessary if the grower will use common sense and his eyes for two or three years.

When the trees become dormant after the first summer's growth, the branches on nearly all of the deciduous fruits, such as peaches, apricots, plums, pears, apples, etc., may be topped back somewhat similar to the topping back of the young trees when planted. These main branches of the first year, like the trunk, are merely a foundation to hold up the fruit bearing wood of a later year. Like the foundation of a house, there is no reason for going beyond reason in this matter. As a rule the first year's growth is left altogether too long. On peaches, prunes, etc., we would suggest not leaving more than six or eight inches of trunk, no matter how thrifty the former year's growth may have been. Three or four of these branches will be sufficient to form a good head of the tree and of course these should be distributed on all sides so as to balance and secure as proper spacing of the tree as possible. If a strong prevailing wind is inclined to tip trees when they get to be larger, the main branches on the side toward the wind may be left slightly longer so as to overcome the wind tendency. With the apricot, however, this is not necessary, in fact, with it some pruners follow the reverse method, because, as every orchardist has observed, the apricot limbs reach out toward the prevailing wind.

One point which must be insisted upon in forming the young tree is that there shall be no narrow crotch formed by two limbs growing up closely together or one large limb coming off from the trunk in such a manner that it will have a tendency to split down when carrying a heavy load of fruit. Limbs which come off from the trunk more nearly at right angles and have a firm junction are the only ones which should be encouraged. Strong sucker growing limbs coming from near the base of the tree often have this form of junction, which, if allowed to grow, will later split down and may completely ruin the tree. Where earlier lack of care has permitted these crotches, the only salvation for the tree is by bolting. We have seen valuable trees saved in this way by boring completely through the limbs just above the crotch and putting say a half-inch bolt through so as to hold the two limbs together. The tree soon grows over this bolt and no harm seems to come from it. For thus boring these holes, the writer had an ordinary half-inch bit lengthened in the shank by the blacksmith so as to permit the boring the hole all from one side. This made the insertion of the bolt an easy matter.

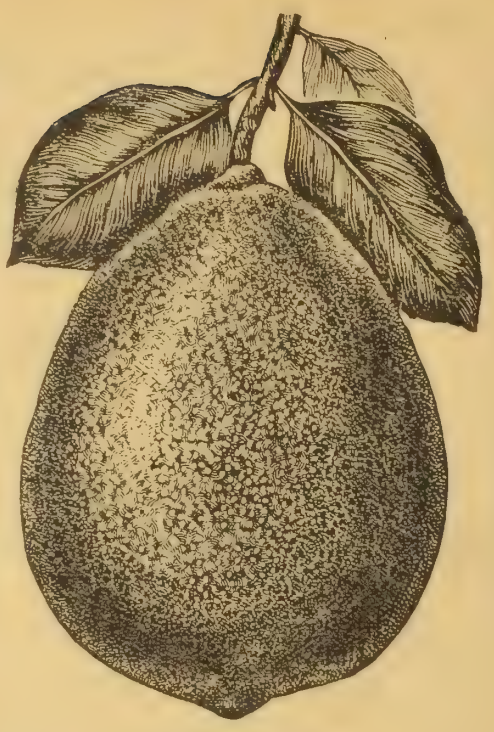
Second Year's Pruning.

At the end of the second year's growth, the branches left after the first year's pruning will have sent out a large number of shoots, probably much more than necessary. If these have been thumb pruned during growth, the pruning shear work will be confined to simply cutting back. This should not be quite so severe as last year, and the length will depend somewhat upon the habit of the tree, that is, the more compactly growing tree will require longer branches in order to separate the top than will that of the more spreading habit. No definite rule can be

Continued on Page 31.

The Wonderful New

Ponderosa Lemon



This truly ever-bearing variety produces lemons of remarkable size. The trees are strong and healthy, easily cultivated and enormously productive. They bloom and bear fruit when quite young. The flowers are pure white, with yellow stamens, and as fragrant as orange blossoms. The beautiful foliage is thick, glossy, and resists insect attacks admirably. A tree of this sort, covered with masses of flowers and large, handsome lemons is a sight to behold. The lemons are excellent for culinary purposes. Usefulness and beauty are combined in a high degree in this remarkable plant. Send for catalogue.

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

ADVERTISE ORANGES AND LEMONS.

FROM an address on advertising by E. O. McCormick before the meeting of the California Fruit Growers' Exchange at Kansas City we quote as follows:

"It has ever been a wonder to me how it can be that men and organizations can muster up the courage to put large sums of money into lands, factories, machinery and materials, incur big payroll liabilities and other obligations; then, when it comes to the most important factor of all—that of making the product known; or, in other words, making the people want it; to hesitate—to consider the publicity as a something apart from the business—a something to be, or not to be done, dependent on the judgment, or perhaps whim of some individual—or to think of it as an expense, or say a gamble. It seems to be true, however, even in these days so full of precedent, that many manufacturers, merchants and dealers who are never satisfied except they have the very best procurable in machinery and men, location and materials, either fall down entirely, when it comes to advertising, or do it with such half-hearted interest and doubt that such trials as they reluctantly accede to are failures. Perhaps I should not term them failures in fact; they are not generally failures as far as they go—but rather failures, because they don't go far enough.

A Commodity.

"Now if I can aid in dispelling doubts which may be entertained by any of the members of this association as to the efficiency of advertising, for promoting its business—enlarging it where it is already established, extending it into new regions, I will be doing about the greatest service it is in my power to render you. To start with, you must recognize advertising as a commodity. It is imperatively necessary that you get this truth fixed firmly in your minds before you can hope to give it that broad consideration which its importance demands. Get away at once and forever, from the idea that it is an expense.

It is not an expense, it is a commodity; just as necessary a commodity in the selling of oranges, as business is conducted today, as are the oranges themselves. I do not mean by this assertion that you cannot go on selling oranges forever without any advertising; but if I understand right, one of the purposes of this convention is to see if means can be devised which will increase the consumption of oranges and thereby increase the sales of the product.

Salesmanship.

"There is no mystery or magic about advertising—that is to say, no more mystery than attaches to doing any other thing well. It is not an experiment. Properly done it is simply good salesmanship. It does simultaneously in a thousand or a million places what an individual can do only in one place at a time. Paradoxically it not only does not supersede the salesman, but is his greatest ally. The better the advertising the better the ally. It is the advance agent of the salesman. It predisposes the dealers and the public and clears the route of the salesman of many of its thorns. Good salesmanship is the ability to induce people to buy your things equally with, or in place of, the stuff that others have to sell. If judicious advertising will assist in creating a demand for oranges, it will add much to the chances of the success of the salesman in his work. That it will do this may be predicated on what it has done in other fields. If you look for evidence of the results of advertising, you may pick it up in the things you do every day.

"There is no limit to the things that may be profitably advertised. Surely, if the staff of life and the graveyard can be promoted by this means there is a chance for the orange. If this be true, then we have only to give our serious attention to the how of the advertising; consider the character and search for the very best method.

Specialize.

"Let us start with a full realization that we live in an age of specialization. Your own business of selling oranges is an illustration of that fact. The grower is all right as a grower; when it comes to marketing he is not in it. That is your speciality. The picked fruit represents the full complement of his investment in capital, intelligence and labor in the orchard. You do not invade his field of activity. His specialty is in studying grafting and planting and spraying and the many other problems and secrets of the still life of the grave—the plowing and irrigating.

What to Use.

"As to the mediums to be used, you know, of course, that the most direct and most easily employed means at our ready command for use in educating desire is the newspaper.

"Reading the newspaper is as intimate a part of our every day life as sleeping and eating. It is a rare person who does not at least glance over his daily or weekly paper, and to the great majority of people it is the only avenue open to their minds accessible to those who have things to sell. The peculiar strength which is all its own is well put by a recent writer in the following words: 'The newspaper carries suggestion into the family circle at leisure moments in parlor or library, where no salesman is ever permitted to enter. It is in closer touch than any other printed thing. To start with, there are in the older communities a vast number of people who have inherited the continuance of the paper which their parents read. It is as real to them as proofs of holy writ. To practically all others, it is their own choice. The intelligence of the world's doings is gleaned from its pages. That which many deem their own judgment, as related to current topics, is merely a reflection of what they have read in their home paper. What reaches them for the first time in today's issue, in a week or a day later has become their belief and knowledge.

The Paper Gets There.

"To most people, all other than newspaper reading is more or less of an effort. Because such reading can be deferred, it is.

Determine just the kind of people and the localities you wish to reach and you have at hand the distribution that will reach them.

"Place your copy today, and by tomorrow, or next week, the distribution is complete. With the newspaper (and periodicals) you know beforehand what and where your circulation is going to be.

"Do not misunderstand my special plea for the newspaper to mean that I think it is the only medium which can be used by you advantageously. You have had recent experience in your Iowa demonstration and which should be a guide for future efforts. It is not my intention to go into details, but rather to point the way which I feel sure will be of great assistance in further developing your

Frost Insurance

By Smudging

THE above caption suggests what is believed to be the correct view of this subject. Orchardists have for years been experimenting, and perhaps trifling, with various means of protection against the ravages of "Jack Frost," with varying results. The past year or two, however, has witnessed a growing tendency to meet this enemy in a way that means insurance against loss by frost, both direct and indirect, that is to say, direct loss resulting from injury to fruit and trees, and indirect loss resulting from injury to market and reputation.

The orchardist who has had experience in smudging has learned that smoke alone will not protect. He has also learned that heat is of vastly more service in protecting both fruit and tree, and that the problem of protection must be solved by the employment of that means of smudging which combines and insures the following essential qualities:

1. A fuel, and a means of using it, that will insure a quick, hot fire or a slow fire, just as conditions of temperature may demand—that is to say, under ready control.

2. A fuel of such quality as to incure convenience in its use, and no deterioration from age.

3. Heat that will raise the temperature convenience in its use, and no five degrees, and possibly six, within the shortest space of time.

4. Cost that is not prohibitive, both as to initial cost and as incident to use.

Unfortunately smudging in the past has been at once ineffective and expensive—expensive both as to first cost, and as to use, namely, lighting of fires and keeping them going long enough to give full protection. On this account the oil pot and the coal basket have failed to meet the demand and may now be said to have had their day.

A canvass of the subject among orchardists in frost-likely sections shows that the ideal fuel for the purpose is made of pine or spruce shavings heavily saturated with low grade petroleum and burned in a simple, inexpensive sheet iron stove, so constructed as to insure great heat or low heat, as may be required, as well as a heavy volume of smoke.

That this fuel and stove are accepted by the orchardists of Southern California as the best form of insurance against frost now available is evidenced by the fact that many of the largest orchards are now thus equipped (about 20,000 stoves being now used), and opinion as to the effectiveness of this form of protection seems to be emphatically in its favor. The Occidental Fuel Company, with offices at 201 Douglas Building, Los Angeles, is putting out this fuel and stove under what has been generally known as the Griffiths patents, and it would appear that insurance against frost, both for citrus and deciduous trees, as well as for tomatoes and other vegetables, may now be had from this company at moderate cost—about ten cents annually per tree for fuel and stoves.

From the foregoing it is clear that protection against frost should be looked upon as a necessary part of the cost of fruit production and should be provided in advance as a form of insurance that does insure. If fire, accident and life insurance, why not frost insurance? And in this connection it may be observed that the orchardist, who thus insures his crop, does not have to die to beat the company for return from investment results every time he saves his crop.

The recent frosts have brought with them a severe lesson to many of the orchardists, and with double force to those who had made no provision for protection. It is a waste of words to argue that because frost has not appeared in a given section for several years it will not, therefore, appear this year, or in any year. In a single orchard the loss from frost two years ago exceeded $20,000, and yet the owner found cold comfort in the fact that frost had not made its appearance in his orchard for more than five years past. That orchard, be it said to the credit of the owner, is now fully equipped with the means of protection heretofore described. It was a case of locking the stable door after the horse was stolen.

The writer believes the whole matter to be one of calculation. It is now a settled fact that frost insurance may be had, and cost is the principal item for the orchardist to consider. It is elementary that if it cost ten per cent, twenty-five per cent, or even fifty per cent of the net value of the crop to save it from destruction by frost, it is good business to incur the necessary expense, and to take time by the forelock by installing in the orchards the best means of protection to be had, and this far enough in advance of expected frost, to insure delivery of materials, and thus obtain absolute insurance.

There is to be a State farmers' "round up" at the Utah State Agricultural College, January 11-25.

Pruning the Vine

By J. W. Mills

THE principal shipping grapes grown in California are Tokay, Black Cornichon, Thompson Seedless, Emperor and Malaga.

Short Pruners.

Tokay, Cornichon and Malaga are almost universally grown in the bush form, like short-pruned varieties. Varieties pruned short are given two buds on each cane that is utilized to form the new top. The three last-named varieties are given at least three and better, four buds if the vines are strong growers of their kind and the soil is rich and is naturally moist or can be irrigated. At the base of each of these half-long pruned spurs should be left one with two buds. At the next pruning time the half-long pruned cane with its current season's growth of canes can be entirely removed and the top for the coming year can be formed from the cane left from the two bud spurs. This produces a stocky vine and keeps the top down, allowing it to gain in height each year the distance of but two buds, while the length of three or four buds is utilized each year in growing fruit. In the case of long pruned vines tied to stakes, the same plan is followed. Long pruner should have five to six buds per cane.

Difference of Opinion.

Where irrigation is possible it is an open question whether or not Tokay, Cornichon and Malaga are more profitable when pruned long and grown on a trellis. In support of this view, one will state that Black Morocco has always been classed as a short pruner, but Mr. Wm. M. Bristol of East Highlands experimented with three vines on a trellis under irrigation and produced several times as many grapes on them as could possibly be grov on the vines if pruned short. He sold his grapes for five cents per pound in the market which vouched for their good quality. We saw the vines when full of grapes after the second pruning under this method and a more satisfactory crop could not be desired. These other varieties, if trained the same way and treated the same with good, deep soil, would no doubt respond equally as well. Where the soil is shallow or even where deep and without irrigation facilities, such treatment of any variety of grape would no doubt be unsatisfactory.

When grown on a trellis, the vines are more satisfactorily handled if the canes that are tied to the vines are allowed to remain and become permanent arms. Trim the canes coming from these arms in the same manner as long pruned vines are, and tie them along over the vines independent of the permanent arms. At each pruning time they are removed to give place to the coming set.

Varieties and Their Pruning.

Thompson Seedless and Emperor are trained as just described. Many growers tie to stakes, which is bad practice for two reasons: grown on trellis they produce many more grapes, the bunches hang free and can be removed in perfect condition at picking time, while when tied to a stake they are often so entangled with the vines that it is impossible to remove many bunches without breaking them and bruising the grapes.

A San Joaquin Vineyard.

Gros Colman is a splendid late grape on Tokay lands in the Sacramento Valley and should be pruned long. These grapes will not crack even when rained on for some time and a light frost does not injure the fruit. They may be held till after Tokays are gone and should bring good prices. The berries are large, as are the bunches, and the rich purple bloom makes them one of the most beautiful of fruits.

Many Persian varieties have been tried in various parts of the state, and with the exception of the Imperial county, most of them are of no value in California. Chavooshee has proven a fairly good sort where others have failed, and is worthy of trial. It is a large, crisp, white grape, and a long pruner.

Golden Queen is one of the best late table grapes, very prolific with good sized even bunches. A yellowish white, and a long pruner.

Cipro Nero is our handsomest and best late colored grape. It is, however, very delicate and cracks on the least provocation. It is one that refuses to produce or grow well if pruned long, but is prolific when pruned half long or short.

Verdal is a late white grape, almost globlular in shape and shows a silver bloom when rained on or covered

with dew. It is a rugged grower and a short pruner.

Olivett de Cadanet is almost identical with Malaga, a little later and with more evenly shaped bunches. It holds its dry quality well and is a long keeper.

Cinsut is a quick maturing, purple grape that is particularly adapted to any soils, in fact does better there than when given rich, moist soil. Bunches are medium in size and compact. The quality begins to deteriorate quickly after ripening. It is, perhaps, a better grape than Malvoisie, which it closely resembles; a short pruner.

Muscat and Muscatel are too well known to describe, and are pruned short.—J. W. Mills.

PRUNING DECIDUOUS TREES.

Continued from Page 27.

given, for to prune some trees back to a foot or less might injure them, although we have seen with good results trees pruned back to that extent of the second year's growth. Some make a rule of removing half to two-thirds of last summer's growth. It is more a matter for the good judgment of the pruner. The balancing and separating of the limbs must be continued the same as the first year.

Third Year's Pruning.

With peaches and some of the early bearing fruits the temptation to leave fruit spurs is very strong, and if reason is observed there is no particular objection to peach and other trees at that age bearing a little fruit. But the grower who wishes a long-lived tree will prevent over-bearing. The grower who boasts that his two-year old peach tree bore a box of fruit will be wiser in late years if he owns his orchard long enough. The third year's pruning is practically a repetition of the second year's except that it becomes slightly more complicated and care must be observed to continue the balancing of the head and to give the last touch to the foundation of the tree.

"Prune to a Bud."

One point which should be borne in mind is to "prune to a bud." That is, make the cut of the foundation limbs slightly above a good thrifty bud, with a slightly slanting cut. Whether this bud shall be pointing outward or inward, or toward the wind, will have to be left to the judgment of the pruner.

As a rule the peach and other trees of spreading habit, most pruners will "prune to an inside bud," that is, the top bud after the limb is cut off shall point inward. This growth as it comes out is more upright than it would be if it came on the outside of the limb. This makes a tree that will carry its load better than if the spreading habit is continued. With many of the compact growing apples, nearly all of the pears and some of the plums, the reverse of this plan is usually followed, that is, cut to an outside bud so as to throw the tree out as much as possible and admit

Small Fruits and Vegetables

OUST THE JAPS.

CALIFORNIA for Americans" is a cry which is becoming more strenously uttered as the menace becomes more fully appreciated. Some most productive sections have been given over so largely to the Japanese that they outnumber the American population.

The former article written by Mr. Roe is attracting attention and the following is communicated by the president of the Brawley Fruit Growers' Association.

"I have just read the article, 'Financial Conditions Facing Small Fruit Growers,' in last week's Cultivator.

"Mr. Roe speaks frankly and truthfully when he lays the blame for low prices for his strawberries on the Japs. We have plenty of Japs here and they behave just about as Mr. Roe says, and from information from other sources I conclude that the menace of Japanese competition in truck raising is already state-wide.

"Last year there were shipped from the Imperial Valley about 1800 cars of cantaloupes and about a third of them were raised by Japanese. This year they will have nearer one-half of the acreage. I surmise that in two or three years the white growers will be out of business not only in the growing of melons, but also in growing onions, tomatoes and other truck.

"We can not compete with their cheap labor and their cheap way of living. Their rice and fish sauce are shipped here from Japan and very little do they buy of our local merchants. Nor are they desirable neighbors. Not saying that they are bad at heart, they are clannish, do not become citizens and do not mix with our society.

Suppose that Mr. Roe's farm had Jap tenants on the east, south, north and west of him; not only had they ruined his business on the market, but they would reduce the value of his land and his home if he lived there. And if he wanted to rent the Japs would give him about what they wanted for he could then get no white man to take the place at any price.

There are some large ranchers here who will rent to Japs before they will to white people and others will hire Japs in preference to whites. Admitting that there is a certain per cent of the white laborers who are worthless, the great majority, if properly fed, housed and kindly treated, are by far better than any other labor we can get.

When you make a contract with a white man you can generally rely on him to fulfill his part, but if you make a contract with a Jap you can rely on him as long as he makes money or gets the best of the deal.

I am convinced that the Japanese are not the people we should encourage to come to our country. Every newspaper and magazine ought to take up the "hue and cry" to oust them from our state.—F. A. Stahl, Brawley.

ASIATIC COMPETITION.

I wish to commend the article in a recent Cultivator written by J. W. Roe on the financial condition of the small farmer, especially the grower of small fruits. Owners of these small farms where fruits and vegetables are grown will certainly be in a serious situation if the Jap and Chinese are admitted freely to this country as some of the "men of affairs" and large fruit growers are now advocating. We "small fry" don't get fair representation before fruit growers' conventions and country life commissions or other such meetings. If Chinese and Jap cheap labor is employed in fruit raising it brings the small grower into competition with them and will eventually crowd us out of business.—R. R. Butler, Hanford.

What Mr. Butler says is largely true, yet in one point we feel that certain correction is necessary, and that is as to the position of the small fruit grower making his wants known before fruit growers' conventions and, possibly, the country life commission. It must be admitted that the country life commission while in California was largely addressed by other than small farmers but we know of one case where a farmer, not highly educated, or possessing a great amount of land, proceeded to make known that there were conditions, even in California, that needed correction. While it is possibly true that fruit growers' convention programmes are largely filled with the larger and more successful growers there are times when the smallest grower may make known his need of help or state any views which he may hold. It is too often the case that many a grower, through lack of study, or more probable through diffidence and backwardness when he comes to the convention finds himself with only a crude idea that something ought to be righted without definite idea in his mind as to any particular solution of the problem. Let the small grower fit himself to make his wants known then let him be forward and insistent on being heard, and there are occasions when the address may be given to ears that will hear. In any case, the columns of the Cultivator are always open and they appeal to a vastly larger audience than the auditorium of any convention which will ever be held.

WEEVILED PEAS.

The pea weevil is a common enemy of both the garden and field crops of peas. The adult insect is an oblong, rusty-black beetle, nearly a quarter of an inch in length. There is a mixture of white on the wing covers and a conspicuous white spot on the back a short distance from the head.

There is only one generation each year. The eggs are laid in early summer on the outsides of the pea pods when the young peas are just beginning to grow. They are deep yellow in color and glued fast with a sticky substance, which turns white on drying. When the eggs hatch, the young grubs burrow through the pods and into the peas, where they live and grow until after the pea is ripe for harvest. The presence of the weevils in the peas may be readily detected when the peas are picked for table use by the presence of a dark spot on the surface as though the pea had been pricked. Before going into the adult stage the grub gnaws a round hole nearly or quite through the skin of the pea, so that it may escape when the proper time arrives. A careful examination of the peas before planting ought to reveal those holes if they are at all numerous.

The grubs change to the full beetle form before fall comes, and most often

It has been estimated that the fruit canners of California will suffer a net loss of $100,000 on this year's pack.

remain in the pea until after the planting the following spring. When peas are stored, many of the beetles will come out during the fall or winter.

The injury to the pea consists in the loss of nourishment which is stored up for the young vine to start its growth the following spring. Only a little over half of the injured seeds ever grow, and the others are weakly and do not produce a good crop. Weeviled peas should never be planted.

Where peas are permitted to go to seed and gathered for future use, the greatest danger lies in those that shell out and remain on the ground until the following year. The beetles live over in these and are ready for the new planting. The only proper way is to gather the ripe peas before they shell out, and be sure that no peas are left in open packages from which the beetles may escape during the winter.

If freshly picked peas are immersed in water heated at 140 degrees for a few minutes, the young, half-grown larvae will be killed and the peas not injured for planting. They may also be warmed to the same temperature in a gasoline oven, but they must be stirred frequently so that all the peas will be equally heated; otherwise some of the beetles may escape while some of the peas are heated so much that their germinating powers will be injured.

If the peas are found to be weeviled at the time of planting, they may be thrown into a pail of water. The sound seed will sink to the bottom and the weeviled ones float, where they may be skimmed off and destroyed. Burn them or feed them to fowls. Do not throw away or bury.

Where peas are used in large quantities for seed, such as field peas, the weevils may be killed by fumigation with carbon-bi-sulfid. Place the peas in a receptacle which is as nearly airtight as possible and put on top of them some shallow dishes. Pour into these the carbon-bi-sulfid at the rate of half an ounce to each bushel of seed. Close the receptacle and let it remain for an hour or more. The fumes of the gas will kill the weevils. This gas is very explosive and fire of any kind, including pipes and cigars, must be kept away or serious results will follow.—Southern Fruit Grower.

POTATO.

Three methods for improving the potato are in use:

1. Crossing desirable plants and comparing their seedlings under controlled conditions.

2. Selecting extreme fluctuations among the plants and tubers of a variety.

3. Finding and isolating sudden changes or mutations.

That advance is possible by the first method is admitted from the results of its use by the best breeders. Theoretically, the new varieties obtained are merely new combinations of qualities which were held by the germ cells of the two parents. If our knowledge of inheritance in the potato were adequate, we could make the proper combination to obtain what we wish at will, but at present we cannot do this because our knowledge of manifest characters is meager and because many characters are latent or hidden in our present varieties and need combining with other characters in order to develop. Therefore, until a firm foundation is laid in the science of heredity, we can do little more than make random crosses between varieties known to possess desirable characters, and compare their progeny with great care.

In this comparison it is well to be extremely conservative about drawing conclusions. Not only should every condition of environment be made as uniform as possible, but it should be remembered that there are stages of growth during the life of the plant when surrounding conditions affect it in different ways. And these differences are not hereditary qualities. For example, one variety grows rapidly and its tubers are half-grown at a certain time, while at the same time another variety has just begun to set its tubers. A drouth at this time kills the one variety, but does not affect the other. The first, however, may really be the best variety and hasty conclusions to the opposite would be premature.

The real effect of selecting fluctuations within a variety (such as selecting the heaviest tubers to improve the yield) is still questionable. It seems definitely settled that the use of diseased and immature tubers as seed has an injurious physiological effect upon the succeeding crop, but there is no evidence that planting the best tubers or planting tubers from the best-yielding plants will increase the yield of the variety. Such an inheritance would necessitate the supposition that germ cells of a large tuber have a different constitution from those of a small tuber of the same variety, and there is no warrant for such an assumption.

Wide variations or bud mutations are rare and have never produced anything especially valuable. They are at present more worthy the study of the scientist than the attention of the practical potato breeder.

The universal belief in the hypothesis that a potato variety must degenerate through continued bud propagation appears to have little ground either in theory or practice. The degeneration that sometimes does take place is due to physiological effects through the use of tubers which are abnormal, from inhospitable soil or climate, or from the ravages of insects or fungi on the plants. The old idea that a change of seed is necessary, belongs to this same category. The phenomenon is entirely physiological.—B. E. M. East of the Illinois Experiment Station.

A MODEL EAR OF CORN

The Missouri Agricultural College at Columbia will lay soon the cornerstone of its new hundred thousand dollar agricultural building, and in the box to be enclosed in the cornerstone in an hermetically sealed glass case, will be deposited an ear of corn that conforms to our present ideals of a good ear as nearly as it is possible to find one. All of the corn growers and breeders of Missouri have been asked to carefully cull their product with a view of finding such an ear.

It is assumed that a century or more hence, when this stone structure is torn down, the people then living will be interested in having the opportunity to see what our notions of an ideal ear of corn were in the early stages of corn breeding.

The California fruit exchange takes exception to a statement made in the recent fruit growers' convention that there is overproduction of deciduous fruits. The manager asserts that the low prices of the past season were caused by financial conditions rather than overproduction.

SEEDS PLANTS TREES

Begin the New Year by planning your garden.

You will need some vegetable seeds; some flower seeds and some ornamental trees and fruit trees. We sell seeds of all kinds—by the 5 cent packet to a car load of Alfalfa .

C. C. Morse & Co. are by far the largest Seed House on the Pacific Coast and hold the very highest reputation for the best grown seeds of the best quality.

We will send our new catalogue for 1909 free to any one who sends us his name and address. This is a catalogue we are proud of and we hope that everyone on the Pacific Coast who is interested in the Garden will send for it. It is carefully written and gives complete descriptions and cultural directions. In it, we are offering several new and attractive vegetables and flowers and a great Rose Novelty from France. Our page on planting and caring for Roses is worth more than the trouble it takes to write for a catalogue. DON'T FAIL TO SEE IT.

Announcement to Smyrna Fig Growers

The following announcement to fig growers regarding figs and caprifigs introduced from abroad and originated for breeding is sent to the Cultivator by Prof. Walter T. Swingle of the Bureau of Plant Industry, Washington, D. C. The Cultivator has refered several times to this fig distribution and it has caused much inquiry on the part of our subscribers. We are glad to have this statement now from Prof. Swingle which gives explicit instructions.

IN order to grow Smyrna figs economically it is necessary to plant in one corner of the orchard a proper assortment of caprifigs to furnish a breeding place for the Blastophaga, or fig insect, at all seasons of the year. Many who are attempting the culture of smyrna figs in California have not planted enough caprifigs and especially not enough different kinds. Besides the standard varieties which yield the profichi used to caprify the Smyrna fig buds in June or July, from six to a dozen or more other sorts should be planted.

During the past ten years the Department of Agriculture has been introducing the best obtainable varieties of caprifigs from the Old World and recently has leased the seedling fig orchard planted at Loomis, California, by Mr. E. W. Maslin, which contains a score or more of valuable new varieties of caprifigs originated in this state.

Caprifig Cuttings Offered as a Bonus for Planting Seedling Figs.

Rooted cuttings of the imported caprifigs and ordinary cuttings of the Maslin seedlings will be sent free by the Department of Agriculture to anyone who will agree to plant out three ceived. The seedlings are also furnished free in the form of one-year-old pot-grown plants ready to set out in condition to start into healthy growth at once. It is suggested that these seedlings be set about 25x8 1-3 feet apart or something over 200 to the acre. Two-thirds of them can be cut out as soon as the trees fruit and the poorer ones remaining can gradually be weeded out or grafted over.

Mr. Maslin's seedlings, although not irrigated, made a remarkable growth, reaching a height of 10 to 15 feet and a diameter of 6 to 10 inches within three years from the time they were set out. Some of them bore fruit two years from setting and many of them in three years.

About half of the Maslin seedlings turned out to be caprifigs and of these one in five has proved to be of value.

Will Have Advantage.

In planting out seedling figs, therefore, the grower is taking the best course to secure new varieties of caprifigs adapted to his particular soil and climatic conditions. All who plant seedlings on these terms will be considered as co-operating with the Department of Agriculture in the fig breeding work and will receive free of cost all publications on fig culture issued in future by the Department and will be given preference in the distribution of any new varieties of figs or caprifigs introduced from abroad or originated by breeding.

New Types of Smyrna Figs Offered for Trial.

Besides the large number of new caprifigs the Maslin orchard contains a half dozen or more new varieties of Smyrna figs which deserve careful trial in order to determine their value for commercial culture. Among them are at least two sorts that show a valuable characteristic not found in any of the imported varieties of Smyrna figs; the mouth of the fig is completely sealed by a drop of pellucid gum that hardens as the fig ripens and effectively excludes all insects and prevents the fruit from souring. One of the new varieties of this type —the Rixford—as grown in 1908 at Loomis without irrigation, showed from 3-4 to 9-10 of the figs self-sealed in this manner.

These and other interesting new Smyrna figs that have originated right here in California in the Maslin seedling fig orchard will be distributed on the same terms as the caprifigs, namely, one cutting for every three seedling figs set out.

Mamme and Profichi Distributed to Smyrna Fig Growers.

California growers having young Smyrna fig orchards have in many cases experienced difficulty in securing the mamme needed to stock up with Blastophaga their caprifig trees, which when young do not carry mamme through the winter. Beginning in April 1909, the Department of Agriculture will send free by mail mamme from the Maslin orchard to Smyrna fig growers for their own use and not for sale. In case profichi are needed to caprify the Smyrna fig crop in June or July the crop of the Maslin orchard will be placed at the disposition of the growers. The profichi, however, must be sent by express collect and the growers must pay the caretaker the actual cost of picking and packing—probably about 30 to 60 cents per 20 pound box.

Co-operators who have shown their interest in the fig breeding work by planting seedling figs will be given preference in the distribution of mamme and profichi.

Names of All Fig Growers Wanted by the Department of Agriculture.

All fig growers are requested to send in their names at once to the address given below in order that a circular giving more details about the proposed free distribution of cuttings, seedlings and caprifig fruits may be sent to them together with application cards ready to sign.—Walter T. Swingle, Bureau of Plant Industry, Department of Agriculture, Washington, D. C.

THE BARNYARD.

The barnyard itself should be kept as tidy as the house grounds. Litter should not be allowed to collect. The shovels, the hoes, the rakes, the bars and the chains should not be left scattered about here and there in the yard. Neither should the plows, the cultivators, the harrows, the mowing machines, the horse rakes and the wagons. This is much more than a mere requirement of neatness. The prolongation of their lives and their greater usefulness for service demand that they be properly housed. Convenience requires that they should be assigned definite places and that they should be found in their places. Then it hardly needs to be suggested that this disorderliness is opposed to all attractiveness.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

INDIVIDUALS; MAN AND COW.

IT is only a few years ago that the central creamery plant, with its feeding cream skimming stations, was considered as a proper way to handle the milk for butter making. The sight of the individuality of the man with the cows as well as the fact that the cows had their individuality was overlooked. The central creamery idea was attractive to the man of capital as a money-making scheme. Large buildings were put up and money spent freely, and yet the success that seemed at hand slipped away, for the skimming station soon was found fully as expensive to handle as a small creamery. The delay and reshipment of the cream to the central butter-making plant was too prolonged. The butter was not so good as that made by the smaller creameries. The true idea seems to have been struck in Denmark, where the exports of butter is watched closely, and whenever a creamery falls down in the quality a government expert goes to help the butter maker find out the cause.

Small Creamery.

The private dairyman with a hundred or two cows never had a better opportunity than at present to make money, for with the milk delivered to the separator as fast as drawn and then ripened at home, there is little chance for the contamination with foreign flavors, or of bacteria having a chance to develop. The products are a little cheaper when delivered directly from the farm creamery. The scale of butter makers' wages ranges higher, for they have to cover a knowledge of how to keep the dirt flavors down that have had a chance to develop during the long ride of the milk to the creamery. The knowledge of controlling these flavors in the worse of the cream and of making the good cream cover up the defects of the bad cream has to be paid for in cash. The pranks of the skilled butter maker have had a kink taken out of them by the law that governs the amount of water in butter. Just how much can be incorporated and held has not been discovered as yet. The greatest amount on record has been reported in a recent arrest of a man where close to 50 per cent. was found in butter shipped out for sale. This padding of butter with water was used to make wonderful records on dairy cows before the days of the Babcock test put the matter on the basis of the chemical amount of butter fat.

Wages.

The present high wages with the inspection of the milk products will not be necessary, and then when this money now paid the creamery managers is divided back again to the dairyman it will mean that he can afford a better head man in the dairy. Surely a man worth $75 a month is more needed in the dairy than at the churn. The individuality of the man who will keep the dairy clean, the cows thrifty, is well worth that money. Removing the dirt and its results is the best the creamery has accomplished. The smaller creamery operated at the farm can go much further by simply not having the dirt in the milk at all. The troubles now at the producing end of the dairy business are very like the troubles at the roots of a tree or vine, they will show up in the fruits. The private creamery owning its own cows has the best control of the conditions under which the milk is produced. The large creameries spend a large portion of their earning in wages to men who claim to be able to eliminate the troubles of the cream. Again individual skill secures the premium. It is worth money every day to do right in this old world of ours.

Co-ops.

These have sometimes been very successful and sometimes the exact reverse, the individuality of the managers has more than a little to do with this success. It is not easy to keep dairymen in line, yet after all, they are much easier to keep working together than fruit growers. Right in this town of Fresno the creamery can hold together with their producers while raisin growers— Well, let's not talk of unpleasant things so early in the new year. It looks as though the Dobbins and Dollies would eat raisins instead of barley pretty soon. The principle that some of the co-operative creameries work upon is to hold back a small portion of the butter fat by making the test run low. This will of course be stopped when the present laws are fully enforced. It was an indirect tax that was better than assessments, in that it was less felt and the remainder could be turned back every year in the form of dividends. Other co-ops paid their stockholders a half cent to as high as two cents more per pound for butter fat than to the outside people that delivered to them.

Farm Separators.

The established creameries naturally do not like the farm separator. It is blamed with all the bad butter made in the market today. Yet this is a most unreasonable claim, for when we know that the milk is not often hauled to the creamery more than once a day and that it is kept in all kinds of warm places until it is delivered, and then is trailed on slow wagons under the hot sun for several hours until it reaches the creamery, surely the dairy could not treat the cream any worse than that. The use of the farm separator is increasing rapidly. In a little while these dairy men will be able to combine and have a churn to make their butter up. The next great change will probably be in the fact that there will be selling houses, and the men doing this will exercise supervision over the different butter makers to make a uniform production.

Steam.

While the larger dairies will use steam to run the separators, the spreading over the country of the power wires will furnish more and more electric plants to the farms. Where steam is used it requires little more fuel than is necessary to make hot water for the washing of the separator and the cans. The direct use of steam to drive the separator is liked better than the use of belts, as these require more knowledge of machinery,

DE LAVAL CREAM SCORES HIGHEST AT GREAT DAIRY SHOW

At the great National Dairy Show held recently in Chicago, cream skimmed with DE LAVAL separators won all highest honors. The cream exhibits were made in two classes and the winners in each were as follows, all being users of DE LAVAL hand separators:

MARKET CREAM.

1st Prize, Gold Medal, G. C. Repp, Ohio ..... Score 98¾
2nd Prize, Silver Medal, W. R. Newberry, Ohio ..... Score 94

CERTIFIED CREAM

1st Prize, Gold Medal, Tully Farms, New York ..... Score 94½

The contest was under the direction of the Dairy Division of the United States Department of Agriculture, Washington, and Mr. Repp's winning exhibit in the Market class was pronounced practically perfect and given the highest score ever awarded by the Dairy Division.

For the past twenty years butter made from DE LAVAL cream has won all highest honors in every important contest. Sixteen of the largest 1908 State Fairs awarded their first prize to DE LAVAL butter and now comes this sweeping victory for DE LAVAL cream in the big Dairy Show contest, which only goes further to prove that DE LAVAL machines are head and shoulders above every other skimming device in every feature of separator use.

A DE LAVAL catalogue tells why DE LAVAL cream is always superior. Ask for it today, or, better still, let us demonstrate the merits of a DE LAVAL separator in your own dairy.

for the second factor of the engine is then introduced. The well pump is as easily operated directly with steam as with belt power.

Changes.

California has gone through many changes since I have lived here, but ever the tendency has been toward the bettering of conditions of farm life. The telephone and the women's clubs have done so much for women that live out on the ranches that their life is full of enjoyment now.—M. E. Sherman.

FOOT-AND-MOUTH DISEASE.

OWING TO the new outbreak of foot and mouth disease in three eastern states — Pennsylvania, New York and Michigan—there is interest even at this distance in this dread disease. A subscriber has written asking information, so we quote from an article in The Farmers' Tribune:

In the first place, it is a disease common in European countries where in years past it has cost the farmers millions upon millions of dollars. It is exceedingly contagious and spreads at a most rapid rate in innumerable ways. Reliable statistics show that in 1890, 431,000 cattle, 230,000 sheep and goats, and 153,000 swine were affected with foot-and-mouth disease in Germany, while in 1883 the same disease caused the English stockmen losses amounting to no less than $5,000,000.

Cause.

Foot-and-mouth disease is caused by a specific virus, the nature of which is not well understood. Repeated attempts have been made to separate the germ, but so far as we are able to ascertain this has not been accomplished. The germs seem to be so very minute that they pass through all ordinary filters used for separating organisms of that kind. One bad feature in connection with this disease is that it affects so many different species of animals, even man being not exempt. While it is essentially a disease of cattle, it also attacks swine, horses, sheep, goats, dogs, cats and poultry. Among the wild animals it attacks the buffalo, American bison, camel, deer, chamois, llama, giraffe and antelope.

Not Necessarily Fatal.

It is not as a rule a fatal disease. In mild outbreaks only one to three per cent of the affected animals die, while in severe outbreaks as many as five per cent may succumb. It usually runs its course in from ten to twenty days, seldom lasting over a period of thirty days. The great loss occasioned to the cattle industry through foot-and-mouth disease is not through death of the animals, but rather through the suffering they endure while the disease runs its course.

In the case of milk cows or cattle on full feed, the loss often amounts to $20 per head. The milk flow of an affected cow falls off very rapidly, which, of course, cannot be regained after recovery until the cow becomes fresh the following season. Pregnant cows often abort while the disease is in progress, or after it has run its course. In the case of fat cattle they frequently refuse all kinds of food for days, and eat but little at any time during the progress of the disease; thus it can readily be seen that the loss may become very heavy. Calves sucking affected cows are often attacked with severe cases of scours that terminate in death.

Symptoms.

The symptoms of foot-and-mouth disease are given in the Special Report on Disease of Cattle, published by the United States Department of Agriculture, in part as follows: "In three to six days after the exposure of the animal to the infection, the disease makes its appearance. It is first indicated by the animal suffering from a chill, quickly followed by an invasion of fever, which may cause the temperature to rise as high as 106 degrees F. Following this in one or two days it will be noticed that small vesicles about the size of a hemp seed or a pea are making their appearance upon the mucous membranes of the mouth at the border and upper surface of the tongue near the tip, the inside of the cheeks, on the gums and the inner surface of the lips, or on the margin of the dental pad. These little blebs contain a yellowish watery fluid, and gradually become more extensive as the disease advances. Soon after the eruptions have appeared in the mouth of the animal it will be noticed that there is considerable swelling, redness, and tenderness manifest about the feet, at the coronet and between the digits of each foot. Eruptions similar to those within the mouth make their appearance upon these swollen regions of the foot a day or two later, and at this stage it is usual to find that like lesions have made their appearance upon the perineum of the victim. In the case of milch cows the udder and more particularly the teats show the same vesicular eruption, but the latter as the result of milking soon become covered with reddened spots deprived of the superficial layer of skin, and may develop deep, obstinate fissures."

After the disease has become well established the animal suffers more or less pain and usually loses its appetite for a time at least. As will be seen from the symptoms above given, the disease almost always affects the feet of the animal in addition to the mouth. Sometimes all four feet become affected, while at other times one or two may escape infection. In severe cases of affected feet the animal lies down and often refuses to get up for days at a time. The result of this is bed sores that refuse to yield to treatment until the animal finally gets up and recovery sets in.

Extremely Contagious.

The disease is not limited to the external organs, but it often also attacks the internal organs as well, and sometimes before external effects make an appearance. Internal affections are very apt to terminate fatally, the animals dying from paralysis of the heart, or from suffocation through the action of poisonous principles, produced as a result of the progress of the disease, upon the heart or lungs. It is because of the extreme contagious character of foot-and-mouth disease that the federal government is adopting such stringent quarantine measures and is battling so heroically to prevent its spread, which, without restriction, would in a short time extend over the United States because of the tremendous cattle traffic in this country.

Quarantine Will Control.

During the last outbreak of the disease in the New England states some

five years ago, the government suppressed it in a very short time and confined it to four states. This was done by enforcing vigorous quarantine regulations, slaughtering of affected cattle and through disinfection of the premises where the disease was found.

The federal government and the three states mentioned above are cooperating with each other, the government bearing two-thirds and the respective states one-third of the expense. All affected cattle are appraised at their full market value, then slaughtered, and the carcasses burned or buried six feet in the ground and covered with lime.

Must Succeed.

It is to be hoped that the government will be as successful with this outbreak as it was with the one five years ago. While the quarantine under which Pennsylvania, New York and Michigan are now placed, though the disease has been found only in a few counties in these states, causes much loss to the live stock interests of those states, there seems to be no other method of controlling the spread of the disease and preventing it from becoming general all over the country.

At a recent meeting of butter makers at Chehallis, Washington, a constitution was adopted and an organization formed with the name of Washington Creamery Operators and Butter Makers Association. The first president of the organization is H. W. Maynard, of Olympia.

HOG NOTES

Lice will make the best hog poor.

Dipping hogs is cheaper than feeding lice.

The well fed sow gives the pigs a good start in life.

Close confinement in filth and dirt always checks growth.

Hogs eat the food from which other animals will get no good.

No stock upon the farm is more quickly turned to money than the hog.

In spite of the fact that the acreage of barley for green feeding in Imperial Valley was greatly increased over former years, the stock shipped in is preventing any excess of supply.

ABSORBINE

"All Wool And a Yard Wide."

American National Live Stock Association

A GREAT convention is called for January 26, 27 and 28 in Los Angeles. It is the twelfth annual of the American National Live Stock Association. President Jastro's call for the convention says:

"Never before in the history of the live stock industry has the need for concerted action been more imperative. Many questions of great interest to stockmen will be considered by the next Congress and the legislatures of the different states, and it is vitally important that all concerned in the prosperity of our industry should now forcibly express their views through this national organization.

"Some revision of the tariff will doubtless be attempted by the next Congress and already certain manufacturing interests are clamoring for reduction in the duties on hides, wool and live stock. In all previous tariff legislation, the manufacturing interests, by reason of intelligent organization and persistent effort, have been able to secure many favors to which they were not justly entitled, and, as a consequence, our meat food products are barred from many continental European countries. In past years this association has forced such reciprocal trade agreements as would permit the admission of our meat products to those countries, and now is the time while the tariff is under consideration to secure such favorable legislation. The special committee, representing the Department of Agriculture, Bureau of Commerce and Labor and the Treasury, which went to Europe for the purpose of ascertaining commercial conditions abroad relative to an increased sale of our farm and live stock products, has returned, and their very elaborate report will be available for consideration at our meeting.

"This association at its last convention recommended, by an almost unanimous vote, a bill providing for federal control of the grazing on the unappropriated public lands in the semi-arid states and territories of the United States. That bill was introduced in the last Congress, and this winter a vigorous attempt will be made to secure its passage. The necessity for some intelligent supervision of the public range, protecting the ranchman and conserving at all times the rights of homesteaders, is daily becoming more apparent, and the increased difficulties of a promiscuous use of the range is continually making new converts to such policy. At our convention the subject will be open for the widest discussion and all concerned in this important question will be given an opportunity to express themselves.

"The administration of the forest reserves by the government will also come up for consideration, and Hon. Gifford Pinchot, Forester and Chairman of the National Conservation Commission, will be present and address the convention.

"Railroad service during the past year has been vastly improved. Undoubtedly the efforts of this association to secure the enactment of laws compelling adequate railway service, furnishing of cars and a speed minimum, has largely contributed to this improvement. In times of good railway service, the necessity for laws which will prevent a recurrence of the disastrous service of former years should not be lost sight of, and this question will be further considered."

Secretary Tomlinson is busy with arrangements for the convention and Los Angeles promises to do its part as entertainer. It will surely be an important meeting which no stockman should miss.

THIS ISSUE.

Subscribers may notice that this issue of the Cultivator is somewhat more extended as to number of pages than usual. Our advertisers have come in to such an extent that we were forced to encroach upon subscribers' space in order to give them location, or else the size must be increased to keep up the usual amount of reading matter. We preferred the extra number of pages in order that the amount of good reading matter that we have on hand may be sent to our subscribers as quickly as possible. In addition we have one or two things held back which will be of exceptional value next week. For instance the leading article next week will be one which was especially written for the Cultivator by Prof. E. W. Hilgard of the State University. It is on the effect of different forms of lime and of gypsum on the soil. It is well worth waiting for.

JOIN THE ASSOCIATION.

The hard fight being put up by the Walnut Association to secure a more general co-operative effort in the marketing of walnuts should be granted the co-operation of every walnut grower in California. Had the walnut growers all been members of the association this last season it is very probable the nuts would all have been marketed at the established price. As it was, the percentage of nuts remaining in the open market was sufficient under the financial conditions which prevailed to weaken the market so that at present it looks rather discouraging for the few cars which have not already met with sale.

At least the solid uniting of the walnut interests would have resulted in injustice to no one and the loss which is now thrown upon some of the associations would have been pro-rated and all secured fairly successful results. "Nothing succeeds like success" is truer nowhere than in co-operation. It must have a sufficient percentage of the entire output or injustice is reasonably sure to fall upon some.

NATIONAL LIVE STOCK ASSOCIATION.

The American National Live Stock Association will hold its twelfth annual convention in the city of Los Angeles January 26-28. This will doubtless be an important event in the history of live-stock raising of California and should have the attention of all breeders. More particular information may be had by reading the announcement on the Dairy Page.

FREIGHT RATES.

The increase of ten per cent on the freight rate has aroused the Pacific Coast shippers as no other act of the railroads has done in years. The injustice of this increase, which it is asserted will put an annual tax of $10,000,000 on the producers of the state of California alone, has caused much caustic comment. The possibility of securing relief seems to be very remote unless the administration comes to the rescue and grants the Pacific Coast line of steamers to connect with the Panama railway. This move is hardly probable, especially if Senator Bristow's statement that both Senators Perkins and Flint are opposed to it.

The recent "rate day" meetings which were held all over the state were successful in registering a mighty kick, but whether this kick will be sufficient to overturn railway plans remains to be seen.

HEALTH SQUAD.

Physicians in San Francisco are taking up a line of experiment along the line which Dr. Wiley did in Washington some months ago. That is, Dr. Wiley secured what he called his "poison squad," and fed them upon foods which he had reason to believe were preserved with poisonous compounds to the extent of being unhealthful. The San Francisco physicians, under the leadership of Dr. Albert J. Atkins, a well known physician and a member of the World's Congress of Medical Science, have established a similar squad of healthy young men, which will be called the "health squad." These men will be fed upon, or provided with, a liberal supply of dried fruit which has been sulphured, as a part of their daily ration.

The prediction on the part of many of the physicians is that the men fed upon sulphured fruits will remain perfectly well and some even predict that better health will result from this diet only of fruit.

We believe California fruit growers need fear nothing as to the result of this experiment for it is very improbable, from testimony of expert chemists who are unbiased that the "health squad" should eat sufficient sulphur in California sulphured fruits to ever injure their health in the slightest.

JUDGING CONTEST.

Iowa and some of the middle west agricultural colleges have classes in stock judging, corn judging, and judging of wheat and other farm products. These classes have various contests at state and other fairs as occasion offers and it has created a spirit of intense rivalry between various institutions which is spurring on young men to perfect themselves in securing knowledge of the perfect points of either stock or other products being judged.

We do not know that such a contest has ever been held on the Pacific Coast, but think the classes of our State Agricultural College could well devote some time to scoring the number of points of products of creamery, field or orchard. For instance if the young men could be taught the strong points of the Washington navel orange, the display at future citrus fairs would show a more uniform colection of citrus fruits than was displayed at the recent Tulare County Fair. California is hardly a strong enough corn producing state to make the interest in judging an ear of corn which is manifested in Iowa, but in the matter of judging the strong points of dairy or beef live stock it is a vital question to many of our young men and we believe great interest and profit may be secured by education along these lines.

In a recent contest at the National Corn Show, the Iowa team went home with a $1500 trophy. At the recent National Dairy Show in Chicago there were teams from eight different agricultural schools in the contests.

ANTI-RACE TRACK.

The anti-race track campaign is stirring up the better element of the state as no other movement has for years. It has likewise created considerable action on the part of the gamblers, which shows that they are awake to the gravity of their situation. Whether they have pull enough with the present administration to stand off for another two years the enactment of the bill which is demanded by every decent person in the state of California, is yet a question. It is unthinkable that such a situation could be supported by enough members of the California legislature to prevent the passage of the anti-race track bill, but sure it is the people of California have elected some men who will support the gamblers. Their names should be made known to the public.

PARCELS POST.

The National Grange is sending to all who wish blank forms of petitions to members of Congress at Washington, asking for their support in securing the passage of Senate Bill 5152, providing for a system of parcels delivery on rural mail delivery routes. The proposed system is favored by the postmaster-general, who believes it would not only be self-sustaining but would create a surplus sufficient to wipe out the present annual deficit of the postal department. The forms of these blanks may be had by addressing the National Grange headquarters, Concord, New Hampshire, but if farmers wishing the support of their representatives in Congress for this measure will write a personal letter to the representative of their district it will have just as much weight and perhaps greater than in the form of a petition. Let every farmer who is interested write, both to the representative and the senator.

FIG TREES.

On the deciduous page this week may be seen an article written for the Cultivator by Prof. Walter T. Swingle, touching upon figs which will be distributed by the Bureau of Plant Industry. This is a valuable opportunity which should be taken advantage of by every one who has land fitted for the culture of the fig. The particulars as to securing these trees may be seen in the article.

The newly seeded area of winter wheat of the United States, is estimated as being 5.6 per cent less than the revised estimated area sown in the fall of 1907—equivalent to a decrease of 1,762,000 acres, and indicating a total of 29,884,000 acres. The condition of winter wheat on December 1 was 85.3, as compared with 91.1 on December 1, 1907, 94.1 on December 1, 1906, and a ten-year average of 92.2.

The feeling amongst fruit growers, especially citrus people, in California is at present one of assurance that the tariff revision will not affect their interests, other than that it is probable no changes will be made.

Shop Talk

SUBSCRIPTIONS.—Orders are received at this office almost daily to discontinue or change the address of the Cultivator without giving the name of the post-office to which the paper has been going. Much confusion and delay would be avoided if every one would bear in mind that we have a large list and that it is impossible to find names without knowing the postoffice address. The list is indexed according to location and not according to name, so all can see the necessity of paying attention to this suggestion when sending their orders.

Agricultural Notes of the Pacific Coast

Northern California

Davis shipped a total of $79,826 worth of almonds during the past season.

Colony Number 3 at Gridley is extending its planting of vineyards this season.

Tehama county's farmers are elated over the possibilities opened up by the Iron Canyon irrigation project.

About twenty-five students began the agricultural course at the State University School at Davis on Jan. 5.

A company has been organized at Yuba City, Sutter county, to plant a large tract of land to eucalyptus trees.

Berry growers of Gold Ridge are concerned over receiving payment for large consignment of berries made to a Napa packing firm.

An effort is being made by Solano county people to secure the construction by the state of a bridge across the Carquinez Straits.

A farmers' institute will be held this week in Yuba City, Sutter county. It will be conducted by Prof. Clarke and addressed by Prof. Bioletti.

A rainfall of from half an inch to an inch was the New Year present to the farmers of the Sacramento valley. Much more has fallen since.

The construction of the levee at Oroville, which will protect a large body of land, is nearing completion. A fill was made for over 250 feet.

Sutter county will have the largest single field of beets in the state this coming year. The contract has been let for 6000 acres to be planted in this one field.

A strong vein of water has been struck at 112 feet on the State Farm at Davis. It is hoped this will solve the problem of irrigating water for the farm.

The Maywood Grange at Corning met recently and arranged a program for the coming year's work, which will add interesting features to many of the evening sessions.

The directors' meeting of the Dairy Exchange recently issued instructions to their inspectors to report to the local agents of the Revenue Department all cases of butter suspected of being adulterated.

The State Board of Trade has information from Washington that Congress will grant an increased appropriation to the Department of Agriculture to the end that the thrips fight may be more strenuous.

A representative of the Central Creamery Company of Eureka, Humboldt county, recently appeared before the Ways and Means Committee at Washington to show that the duty on casein should not be removed.

The following prices were paid at the last division of the creameries of Humboldt county on butter: Pioneer, 36 cents; Grizzly Bluff, 36; Eel River, 36; Capital, 36½; Riverside, 36½; Ferndale, 38; Cream City, 38; Central, 38.

The Davis Almond Growers' Association in a recent report shows that the last year's output was the greatest since the formation of the association. The total output was 322 tons of almonds and the average price 9 7-8 cents per pound. Growers outside the association marketed 46 tons which netted 9½ cents.

Central California

English walnuts will be planted more extensively than ever in the Santa Clara valley.

Selma Chamber of Commerce has voted against endorsing the Fresno county good roads bonds.

Nurserymen at San Jose report heavy orders for deciduous fruit stock and planting will be very heavy.

Raisin growers have united and made a compact with the packers which as a rule is acceptable to the growers.

The Porterville district will have quite an extension of its orange acreage from this spring's planting of citrus trees.

Senator Perkins reports that efforts are being made to secure the passage of a law permitting the use of sweet wine in medicines.

Coyotes are doing much damage to farmers near Santa Clara. One farmer reports that fifty or more attacked his poultry yard recently.

Delano is busy these days with drilling of many wells for developing irrigating water and in grading lands for the planting of orchards.

Farmers about Lodi are now hoping that a sugar factory and refinery will be established and that a valuable industry will be built up about it.

A large number of land owners near Lodi have contracted with the Alamitos Sugar Company for quite a production of sugar beets this year.

An effort will be made to establish a sewer system in the California Redwood Park so that campers in that section will find healthful conditions.

The Sempervirens Club of San Jose has been assured by the Governor and Forestry Committee that no more large trees will be cut in the Big Tree Basin.

A large firm is about to build a winery at Turlock. This is said to be independent of the trusts and by a company which now owns ten large wineries.

Nearly 600 miles of mountain trails have been built in the government forest reserves during the past year. This is to aid in better patrolling and fire protection.

Farmers near San Jose are engaged in a shot gun warfare against the city garbage dumpers. The war is on the ground that they do not wish garbage dumped near their homes.

The Woman's Club of Bakersfield is offering prizes for the finest grown chrysanthemums and other flowers. Especial prizes are to be offered to school children who can show the finest gardens.

Prune growers who have been investigating the condition of the market have found many market points of the east are overstocked with prunes shipped several months ago. There is evidence however that the market will be in better condition within a short time.

The campaign against the thrips is being more fiercely waged in the Santa Clara Valley than heretofore. Not only are the local orchardists prepared for any fight possible against this pest of prune and pear, but the Bureau of Entomology is sending an additional force of workers to aid in the coming campaign.

Southern California

Quite a number of cattle near Ocean Park, Los Angeles county, have died of blackleg.

Redlands shipped up to the end of December 104 cars of oranges and 57 cars of lemons.

Large numbers of shrubs and trees will be planted on Rubidoux Mountain at Riverside this spring.

The feeling is growing stronger that date culture will be a complete success in Imperial and Coachella valleys.

It is estimated that nearly 2000 acres of apples will be planted near Beaumont, San Bernardino county, this year.

Forest rangers and others are putting out a vast number of trees in the Sierra Madre mountains north of San Bernardino.

From 6000 acres of beets grown in the neighborhood of Compton this year, a half million of dollars was received by the farmers.

The supervisors of Imperial county will give shade trees to all property owners who will plant and care for them along their roadways.

It is estimated that not to exceed 1200 cars of cantaloupes will be grown in the Imperial Valley this season. Many of these will be grown by the Japs.

The Colorado river has begun on its semi-annual rampage which usually comes at this time of the year. It has been caused by heavy Arizona rains.

The Anderson Barngrover Co. has begun other suits against Southern California walnut growers asking injunction and damages under dipping patents.

The California Folding Crate Company, located at Anaheim, has a patent on an improved folding crate which, it is claimed, is a great convenience.

The rangers of the Pine Mountain and the Santa Barbara Forest Reservation were called in conference at Santa Barbara recently and entertained at dinner.

The storage of walnuts yet in Southern California is causing some discussion as to the disposal of them, but every effort is being made to prevent any serious cut.

But few growers of oranges will admit any damage to the fruit from the recent cold spell, and as time passes the assurance is stronger that the damage will be very slight.

It is now assured that the Laguna dam, built by the Reclammation Service across the Colorado above Yuma, will be completed so that water may be turned on the desert lands this coming spring.

An effort is on foot to form two or three new walnut associations in Orange county, especially at Orange, Tustin, and San Juan Capistrano. Frank Kellogg of Santa Barbara is promoting the movement.

The planting of cotton in Imperial Valley is attracting more and more attention, and the success of this industry is assured by the promise of the American Nile Cotton Company, it having agreed to have a gin and compress in readiness for handling the next season's crop at El Centro. A carload of seed is on the way to El Centro from Texas.

The Coast

There will be 60,000 acres of potatoes planted in Colorado the coming season.

Mexican cattle introduced into Montana are proving remarkably hardy and successful on the ranges.

Spokane will have one of the largest poultry and pet stock exhibits ever seen in the northwest January 26-30.

Over $13,000,000 worth of stock was handled through the Union Stockyards at Denver during the year 1908.

Sunnyside, Washington, wants a cannery. The shipment of tomatoes from that town last summer was 625 tons.

A Lewiston, Idaho, live stock dealer says that the scarcity of feed is proving very embarrassing to stockmen.

Milton, Oregon, has procured some of the best prices for apples this year ever secured by apples grown in that section.

The Utah Agricultural College will conduct a Farmers' Institute train through that State during the next few months.

The director of the experiment station at Moscow, Idaho, is offering silver cups for the best butter fat records of a herd of five or more cows.

It is estimated that 3,000 sheep men will attend the 45th annual meeting of the National Wool Growers' Convention in Pocotello, Idaho, this week.

The Stockbreeders Association of Washington has elected a legislative committee to look after interests of stock growers in the state legislature.

Poultry raising is destined to be one of the greatest factors of Western Washington and great increase in the industry is promised for the coming year.

At a meeting of the Pure Breeders' Association at Spokane Washington it was reported that the Alaska-Yukon Exposition next year will offer $3000 for stock judging contests.

One potato grower on the Little Spokane River, Spokane county, Washington, succeeded in producing 800 bushels of potatoes per acre. They were of the Burbank variety.

The National Western Stock Show will hold its fourth annual exposition at Denver, beginning January 13. It will be the first meeting in the new amphitheatre costing about $200,000.

In the cold snap at the end of December which extended over the entire Pacific Coast, Portland was given a 20 degree temperature which it is claimed is the lowest in ten years.

Farmers at Monte Vista, Colorado, are discussing the extension of irrigation ditches and the proposition is to be voted upon for a bonded indebtedness of $550,000 for extension of the system.

During the coming session of legislature of the state of Colorado, it is expected that an appropriation will be made for an irrigation experiment station. It will be in charge of the State Bureau of Irrigation.

The Wenatchee Valley Fruit Growers' Association recently made a division of funds for fruit handled by the association, amounting to $75,000. The total of the association's business during the past year was $350,000, divided among 250 members.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. You ***can't*** afford to try and be successful and not get results. ***Midland Poultry Food*** will produce results. Try it and see. $1.95 per sack

PETALUMA Incubators and Brooders

Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards, and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

S. E. Gregg East Adams St. Riverside, Cal.

White Wyandottes

My San Jose Winnings: 1st, 2nd and 3rd Cock; 1st Cockerel; 1st, 2nd and 3rd Hen; 1st and 2nd Pullet. The above winnings were made out of ten entries.

Box 60, R. No. 1 Mrs. C. D. Hubbard San Fernando, Cal.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CHICKEN EXPERIENCE.

LAST February and March, we hatched with incubator and hens about three hundred White Leghorn chicks. The losses with the hens were considerable, with the brooder, very light. At six weeks we sold the broilers at three dollars per dozen. About that time we sold twenty fat old hens, altogether realizing forty dollars which we considered paid for our young stock up to that time. We had on hand then about one hundred fine young pullets, and thirty-five year-old hens.

The yearlings fed the youngsters from then till the first of September when the young pullets began laying. From then up to this time, our chickens have cleared us a dollar per day. This, considering the high price of feed, we consider satisfactory.

We keep grit, charcoal, and oyster shell always before them. We feed a dry mash in hoppers all the time, and a light feed of wheat in deep litter in the morning. At night, we throw them a heavy feed of wheat, all they will clean up before going to roost. In chilly weather, we boil the wheat and feed it hot. All the time the chickens have access to green alfalfa, and to a shed where dry alfalfa is stored. They like to pick and scratch in the litter of dried leaves and chaff about the stack. They nest all over it, and a large tent adjoining the stack is utilized as a scratching place in stormy weather.

We keep a five gallon trough always filled with milk, either sweet or sour. At the creamery we get the sour milk at the rate of five cents for ten gallons. We are careful to keep the milk can and the milk trough sweetly clean. Our cow furnishes some milk for the chickens. The milk we consider the cheapest and most important part of the ration.

As we do not have water piped to the yard, how to keep fresh water always before the chickens has been our greatest problem. Finally we secured a ten gallon barrel and inserted a wooden faucet near the bottom. The faucet drips constantly into a granite iron pan, which overflows in to a long trough. At the far end of the trough is an auger hole which lets the excess of water off into a covered well. By this method, there are no muddy puddles around the water trough for the chickens to drink from. A low bench set over the trough keeps the chickens from soiling the water. The whole arrangement is set in the shade of a huge oak tree, which, by-the-way is one of the chief assets of our poultry yard. The water in the trough was cool on the hottest days last summer.

The barrel was filled early every morning with fresh, cool water.

In the shade of the oak, a large space was spaded up for dust baths. In dry weather, the stale water from the barrel was sprinkled each morning over the dust baths, to the great joy and comfort of the chickens who prefer moist dust to dry, every time.

The roosting house is cleaned once a week, and sprayed or white washed about once every month, oftener in summer. It is closed every morning as soon as the chickens are off the roost, and not opened till night, so that the chickens cannot scratch and pick amid their droppings.

Our chickens are never lousy, or sick, and the egg production has been steady all fall and winter. We are amateurs in the poultry business, and the Cultivator has been our only literature on this subject.—Mrs. King, Gridley.

And still lots of people are going out of the poultry business. Of course all do not get as cheap feed as does Mrs. King's stock but all may follow her painstaking methods and be almost as successful. We congratulate her on her attention to details and on her success.

BROODERS.

THANKING you for former help and knowing that you are glad to be of service to your constituents, I come to you with further questions.

1st—To one in this climate, and who must be as economical as possible, expecting to brood out about 300 chicks at a time, is a brooder house with indoor brooders, enough better than a brooding coop snugly made, say three feet wide, 20 feet long and two feet long, divided into six compartments for 50 chicks each, to be worth the difference in cost? For a source of heat my thought was to have a one-inch pipe for hot water run the length of the coop, drop five inches and return to starting point; just over the return pipe have a board 12 inches wide, making the floor of the hover apartment, thus heating directly by the upper pipe and indirectly by the lower one; for I would have one or two tubes for each compartment conveying fresh air from outside against the lower pipe to be warmed and pass into the general chamber.

Is the plan a good one? How shall heat be applied at the end of the pipes to make circulation sufficient and the pipes hot enough?

Shall the pipes be connected to a two or three-gallon reservoir with a little gasoline stove under that? Or is that much more than is necessary? Would it need only a single short joint of pipe connecting the two lengths and would a kerosene lamp be sufficient, or would a little kerosene or gasoline stove be better?—H. H. Davis.

Mr. Davis' query is one that shall be my text for this week's subject, as it is a query that is troubling so many at this particular time, and to all I have good news to tell, for they may rejoice and be exceeding glad at being free forever from the thraldom of pipes and lamps and smoky, dangerous brooder stoves.

Fireless brooders have solved these problems perfectly, and are in successful operation as far east as New York, and may be used in this climate the year around, saving the expense, worry and danger from the multitudinous brooder fires so long the menace of poultry farming.

Instead of making one long building for all his flock, if Mr. Davis will make several small buildings, which will answer for colony houses as the chickens grow, and which may be

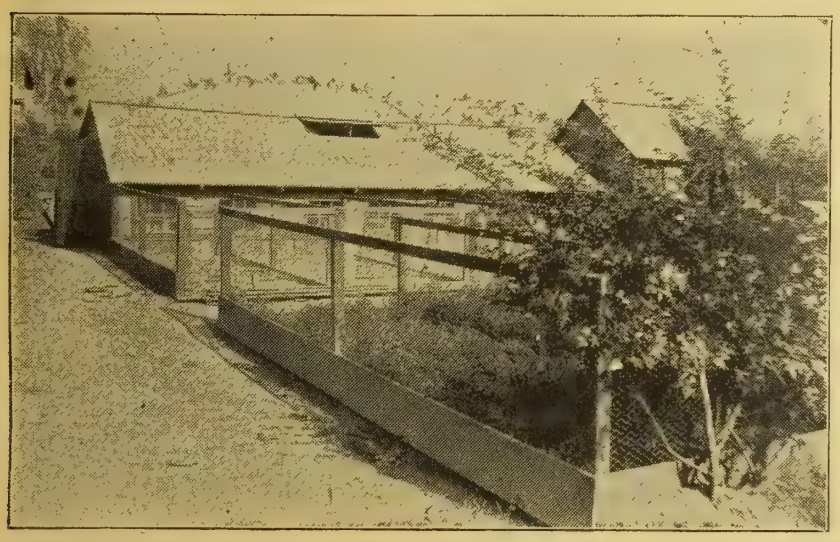
easily moved from place to place, I think he will find them much more satisfactory.

Then if disease should gain a foothold in one lot, the whole flock will not be in so much danger, and more yard room can be planned for each flock in this way, as the different sizes should be kept separated, even a week making quite a difference in small chicks.

The expense that would have gone into pipes and lamps, etc., can be added to the making of ends for these little houses, which I like about six feet by eight, or at least six feet square for each 50 birds. Now, the hover for a fireless brooder is a very simple affair, easily made at home, and a good model is to make a small table two feet square, with six-inch legs, or else use a box six inches deep, with holes bored in three sides and one side taken out. If a box is used it must be turned upside down and all around the sides thick cloth must be tacked, slashed up every three inches for the chicks to get out of, and similar strips of cloth tacked across every three inches to hang from the top to the floor, slashed likewise. Cloth that don't in and out of in each of the four sides of the box, protected by a curtain of thick, slashed cloth, and enough air will percolate through the feathers for ventilation, and yet the chicks will be warm and cosy. Any one who has ever slept under a delightful old-fashioned feather bed will appreciate this fact, and those who haven't have missed something.

That fireless brooders are practical and just the thing for this climate has been thoroughly tested, and no one need be afraid to try them. I used the pipe system to my sorrow last season, and my chicks smothered at one end and chilled at the other in one of those long pipe affairs. They were too warm at night near the lamp, and when let out in the morning would shiver and chill and catch cold and die, until I was in despair and lost more than I raised.

If one thinks heat absolutely necessary, borrow an idea from the fireless cookers on the market. They are simply big boxes stuffed with hay, with a hay padded cover, airtight. In these boxes are nests for kettles, which are put in boiling hot, and the box quickly closed, where they cook for



Brooder House and Run With Alfalfa Planted.

avel must be used, or the chicks will ang themselves in the ravelings, as have found to my sorrow. The idea s for the chicks to run under this over whenever cold, as they will oon learn to do, and the heat generted from 50 chicks is sufficient to eep them warm enough. More chicks ie every year from over heating in rooders than from any other cause, ave lice, as over heating causes bowl trouble, colds and roup.

Clean chaff or fine straw should be laced under the hovers for the chicks nestle upon, and if a very cold spell ould cause you to worry, place a g of hot water on top of the box r table,) but if the water is too hot ey may overheat from that, so it is enerally best not to use it at all.

Two different kinds of fireless ooders are upon the market now, t they are so very simple, one can ake them at home.

Another plan I have seen, is to use quilt of cotton batting, for the chicks nestle under, which bags down ough so the backs of the chicks me in contact with it, and this akes a nice substitute for the moth- hen, but the sides of this one were arded in, and ventilation allowed m above through the quilt.

Now I will give you my plan: Make loose bag of feathers, of some sleazy th like cheesecloth, first being sure at there are no nits or lice in the thers, and tack this inside a box it will sag down over the chicks a tle. Make a door for them to go hours and hours. A box made on this plan with a nest for a jug of hot water would make an ideal brooder, by setting it up on legs, and putting a curtain around the bottom. The hot water would have to be renewed every twenty-four hours only, and there would not be the slightest danger from fire.

Not much hay should be placed under the jug, but plenty should be covered over it, with a tight board cover in addition, and the jug tightly corked. I have been thinking about this hay box brooder so much that last night I dreamed that I hatched chicks in the top of one, and hovered them under it at one and the same time, and by the way, a man back east hatched a good percentage of chicks in his apiary above the bees, utilizing the heat they threw off in this way. But that is another story.—Mrs. Frank Metcalf.

Summer is a busy time with farmers, and many neglect to provide perches at the proper stage of the chicks' growth. We neglected to look after some of ours in this respect last season, and the neglected birds did not grow as long, heavy plumage as those that were furnished perches when old enough to fly up to roost. On the roosts their bodies are in contact more with the open air, which favors a heavy growth of feathers.

Young geese are ready for market when the tips of their wings reach the tail, which is when they are about ten weeks of age.

Great Fences

AMERICAN FENCE

Made of wire that is all life and strength — wire that stretches true and tight and yields just enough under impact to give back every jolt and jam it receives.

Made of materials selected and tested in all the stages from our own mines, through our own blast furnaces and rolling and wire mills, to the finished product. Our employment of specially adapted metals is of great importance in fence wire; a wire that must be hard yet not brittle; stiff and springy yet flexible enough for splicing—best and most durable fence material on earth.

To obtain these and in addition apply a quality of galvanizing that will effectually protect against weather conditions, is a triumph of the wiremaker's art.

These are combined in the American and Ellwood fences—the product of the greatest mines, steel producing plants and wire mills in the world. And with these good facilities and the old and skilled employes back of them, we maintain the highest standard of excellence possible for human skill and ingenuity to produce.

Dealers everywhere, carrying styles adapted to every purpose. See them.

THE $7,500 FOWLS

Bought by Madame Paderewski

Were hatched in the World's Best Hatcher—a standard Cyphers Incubator, and raised in a Cyphers Brooder. The breeder of these five fowls, like scores of others who get remarkable prices, says, he will use nothing but Cyphers machines. See his letter among many others in our 1909 catalogue.

CYPHERS FIRE-PROOFED, INSURABLE INCUBATORS AND BROODERS

The first Fire Insurance Inspection Label ever issued on Incubators and Brooders has just been granted to Cyphers Incubator Company by the National Board of Fire Underwriters. Now you can insure your incubator, brooder and buildings only if your machines bear the Insurance Label. Our 1909 Catalogue, 212 pages, fully illustrated, tells all about it, and contains five valuable chapters on the poultry business. It is Free. Write for it.

POULTRY QUERIES.

Canker.

Can you tell me what is the matter with my young pigeons? They have a swelling in the neck which sometimes is very hard, and often, but not always, looks something like canker. They are usually taken sick when from one to three weeks old and die in from one to two days afterwards. The parents are fed whole wheat and cracked corn and are, in appearance, perfectly healthy.—A. H. P.

Canker is such a common disease among pigeons that this is probably what your little ones died from. The treatment recommended by Mrs. Basley's Poultry Book is four grains of sulpho-carbolate of zinc to one ounce of water. Paint the canker spots with this night and morning and in three days the germs will be destroyed. Be very careful that no musty grain is fed, and cut out the cracked corn for a few days, substituting bread and milk and chopped onions.—Mrs. Frank Metcalf.

• • •

White Orpingtons.

Please give me some information in your Poultry Department about white Orpington chickens, their habits and peculiarities; whether good layers, good setters, heavy eaters, etc.—Franklin H. Dunham.

The Orpingtons are an English breed of large size and great beauty. The weights are: Cock 10 lbs., hen 8 lbs., cockerel 8½ and pullet 7 lbs. The Whites are as good as any variety of them, and if you are where hawks are not troublesome, they will suit you as well as any of the class.

Being English, they have white, or pink legs, and white skins, and are rather a better breed for the table than for laying, their eggs being small, and, like all very large breeds, not produced in as great abundance as some of the more active breeds. The Orpingtons were originated by William Cook, who died in 1904, but whose sons carry on the breeding of these fine birds in New Jersey. I met Wm. Cook at Rochester N. Y. a few months before his death and was much impressed by his earnestness and kind friendliness, and regretted his untimely taking off very much. His work in giving this grand breed to the poultry kingdom is a living monument to his skill. "His labor lives, his work survives. He lives on earth a thousand lives."

• • •

Pullets for Breeding.

We have some nice S. C. White Leghorn pullets which will be a year old in April. They are laying nice large eggs. Do you think they would be good eggs to set? The roosters are the same age. Would it be advisable to use them, or get others? There seems to be a difference of opinion concerning inbreeding, and we want our stock to be strong and vigorous.—Mrs. F. H.

The eggs from one-year-old Leghorn pullets should do to set, but two-year-old hens make better breeders, and the chickens are apt to be stronger from the older birds. If you do use the pullets, by all means get older males, if possible. Inbreeding, as you suggest is detrimental to the vigor of the flock.

Line breeding, carried on by experienced, skillful breeders is all right for those who have time to study the individual characteristics of each bird, toe-mark and pedigree the chicks, etc., but scarcely advisable for inexperienced people. In line breeding a mating of father to daughter, and son to mother is advised, but not brother and sister. My own way while working out my Buckeyes was to put out good males of one year's breeding among farmers, and bring them home after a year's absence to mate with pullets raised while they were away. If your males are nice, perhaps someone in the same predicament might exchange with you for the season. If you do mate the cockerels and pullets together, you will raise more cockerels than pullets, it is likely.

Of course, if your birds came from eggs from a large flock, there is not much danger of their being very closely related, excepting in a few cases, and you may get very good results from the present mating, but if you do mate them together this year, be sure and introduce fresh blood another year.

• • •

Colds.

Will you kindly let me know through the columns of the Cultivator, if it is roup my leghorns have or simply a cold. I have a cock and eight hens that I have taken away from my flock, one or two each day. They come off the roosts in the morning blinking one eye. The next day a little pus comes out. I dip their heads in coal oil and in three or four days they are all right again.. Now, would that affect them for breeding purposes?—A New Subscriber.

The birds just contracted a common cold, which your prompt treatment effectually stopped short of roup, hence these birds will be all right to use for breeders, after they are perfectly well. Be sure that there are no cracks or knotholes causing a draft of wind to strike the birds while on the roost and keep the coops clean and free from mites by a liberal use of coal oil or distillate, and I think you will have no further trouble.

• • •

Pigeons.

I am eleven years old. I like to raise pigeons, and I've got one pigeon that will not let other pigeons sit on their eggs, and so spoils all the eggs. Please be kind enough to let me know in the next Cultivator what I can do with him. What makes pigeons lay eggs on their perches, please? I've had so many eggs broken in that way I would like to find out the cause.—Charles Prikryl, Los Angeles.

The pigeon that bothers the others so must be kept separate while the rest are brooding. Make it a wire netting coop and keep it there until it learns to behave better.

The best way to save the eggs which are laid while the birds are roosting is to place a floor under the perches and put plenty of straw on it so the eggs will not break when dropped at night. Usually it is young birds that drop their eggs in this way and as they grow older they will know better, perhaps.

BELGIAN HARES.

REGARDING a query which recently came to the Cultivator and was only partially answered at the time we have here the following from Miss Bee Josephine O'Malley of Kanova Ranch, Anderson Shasta county:

"As to where Hares may be obtained I am unable to state, but as to their care the following is a brief summary:

"In starting to raise hares on a small scale—which is the best way to begin anything—purchase, if possible, a bred doe and a buck, not akin either to her or the sire of the expected offspring. Provide cages or pens roomy as your facilities will permit but not less than 12 square feet of floor space in each pen, and not less than 2½ feet high. We found one of most satisfactory pens to be those 4x8 feet. They were built in sec-

INSIST ON

Poultry and Live Stock Supplies

631-37 Brannan St. San Francisco, Cal.

against the wall of a building, the lower pen being about one foot from the ground, and another pen 2½ feet from the floor of that. The wall of the building formed the back, the floors were matched boards, and the fronts and ends were one inch mesh poultry netting; doors 18x24 inches were placed at the outer ends of the front, and a removable wire partition was made to fit in across the middle of each pen, this making 2 or 4 pens in each place as occasion may demand.

"The pens must be made tight and the wire well tacked in place, and the doors must fasten securely. Provide each pen with "muss-pan," i. e. a medium sized pan or shallow tight box such as a tobacco butt, filled partly full of sand, sawdust, short straw or any absorbent material, and if a small amount of the excreta be placed in this box, the hares will use it regularly for excretory purposes and save much labor in keeping the pens clean. which must be done.

"We put these tiers of pens about 2 feet apart along the wall, this giving good circulation of air and yet keeping the pens in compact form for ease in caring for them.

"The pens must be dry, airy and free from drafts.

"The feed is much the same as that given any ruminant animal, with the addition of bread and milk or oatmeal and milk where possible, for the nursing does and young leverets just begining to eat.

"Hay, particularly clover, alfalfa or millet being the main diet supplemented with green stuff, grass, cabbage, kale, carrots, weeds, tree sprouts, etc., in reasonable quantities, also vegetable waste, small beets etc.

"Keep watch of the droppings, if too loose diminish the supply of green food, if too hard, increase it.

"During very cold weather in northern Chio we fed some corn, but oats either whole or ground is a better feed, wheat and barley are also good, a handful of grain once a day is sufficient and the amount of hay is a matter of judgment. Feed regularly what they will eat clean, not enough that they will waste it, nor so little as to keep them ravenous. They should be given clean cool water once a day or oftener in very hot weather; a lump of salt occasionally is a benefit to them.

"The sexes should be separated as soon as the leverets are weaned, and after breeding, each hare should have a separate pen.

"My experience in natural history has taught me that the gentle dove and timid hare can either of them put up the most vicious fight it was ever my misfortune to witness. A bull terrier's fighting propensities are mild compared to a good strong lusty hare, particularly a doe.

"While the doe will breed every 33 days if so permitted, four litters a year are the limit of reasonable profit, and three are better.

"To sum it all up: provide clean airy, dry pens of reasonable size, feed clean, wholesome food in suitable quantities, give them regular care and you will have good results.

"As to allowing them their freedom—we never did that, as ours were too valuable to be permitted to take any chances with stray dogs, or opportunity to run away and get lost, and, also a hare has very poor discriminating qualities, and would be very apt to ruin one's best trees and plants if opportunity offered, taking it all in all I prefer to shut them up closely and select their food myself.

"For fear of making this too lengthy I will leave the care of the leverets for another time.

Hoping that this may be of benefit I am, Most truly yours—Bee Josephine O'Mealey, Kanova Ranch.

THE OWNER OF DAN PATCH GIVES SOME LATE FACTS IN REGARD TO THE WORLD'S CHAMPION.

Written for the Cultivator by M. W. Savage, owner of Dan Patch.

During the past few months I have noticed the various comments printed about Dan Patch and his 1908 performances. Some of these have been written in all fairness to the fastest horse that has ever lived, and have been based on facts. Others seem to have been written under pressure of prejudice or based on absolute ignorance.

We have many truly great and fast horses in this country and new ones will develop from time to time. As a horse breeder I certainly believe this or I would not continue in the business. I do not wish to appear as trying to detract from the greatness of any horse, but simply to state facts about Dan Patch.

Early in the summer I stated that Dan Patch was faster than ever and that although he was twelve years old he would pace the fastest mile in his life. Dan's first fast mile this year was the last week of August, when he paced a mile in 2:00 with every eighth in fifteen seconds. At that time I told Hersey that his first mile proved my statement and that it was the easiest and best mile I ever saw Dan pace, and I saw his miles in 1:55¼ and in 1:55. Dan's second performance was a mile in 1:58¾ finished where a tremendous crowd had taken possession of the track with just room enough for Dan to pass between the crowding people. His third mile was in 1:58 and his fourth mile was paced in 1:57¼. On October 11th, at Lexington, Dan paced the first quarter in twenty-nine seconds and the second quarter in twenty-seven and one-half seconds, at a 1:50 clip. He was at the half in 56½ seconds, a 1:53 clip, and at the three-quarters in 1:25½. At the seven-eights the pacemaker, driven by Scot Hudson, broke a blood vessel and slackened down enough to shorten Dan's tremendous stride of twenty-two feet and yet Dan Patch finished that mile in 1:56¼ which all fair minded men must acknowledge was by far the fastest and greatest mile in the life of the fastest harness horse in the world. Hersey states that when this happened that Dan was going easy and was not tiring and that, barring the accident to pacemaker, Dan would have surely beaten 1:55. In no other year has Dan ever started out with a mile in 2:00 and then reduced it every performance. His last mile is absolute proof that Dan Patch in his twelfth year was faster than ever, which is doubly remarkable from the fact that Dan has been performing these world famous miles for six years.

From some of the comments I have seen printed the readers would be led to believe that it was a very ordinary event for a horse to pace faster miles at twelve years of age than any other pacer has approached at any age. I am sure that the facts carry me out in my statement that Dan's performances in 1908 were the most remarkable in his entire life and indisputable proof that he was faster than ever. Is it not an astonishing event in all harness horse history when Dan Patch at twelve years of age paces the fastest miles in all of his wonderful career? Dan returned to my farm in good shape and is jogging sound and full of life and energy. I have no doubt but what he will be able to give a good account of himself in speed performances during 1909, to the gratification of his millions of warm friends.

I will make the prediction right here that Dan Patch will pace faster miles in 1909 than have ever been paced by any other horse. Very truly yours, M. W. Savage.

Coulson's Special Dry Chick Food

Makes Them Grow

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

Saves One-Third the Labor

Wouldn't you like to cut your labor expense an even third? You can do it on your spraying—and this advertisement tells you how. What's more, the work will be done more quickly and better. Use

Bean Magic Spray Pumps

The Bean patent spring (shown in the cut), divides the work; the operator does half at each stroke of the handle, and works against but half the pressure indicated on the gauge. Bean Magics are built in two sizes; both have non-clogging ball valves, porcelained cylinders, and other exclusive Bean features. They're the easiest running, least troublesome pumps on the market.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; mention number of acres and kind of fruit.

General Agriculture

A NEW LOCUST EXTERMINATOR.

The Mexican authorities in Yucatan have discovered a means of exterminating the seventeen-year locusts that have infested that region. It is declared that by exercising ordinary care a whole swarm of locusts may be destroyed within a few hours without any danger whatever to cattle. A trial experiment was carried out in the following manner:

"The swarm of locusts destroyed in this instance measured about 500 yards in length by 200 yards in breadth. They made their path in closed files, and had already devoured all that they found in their way. One pound of arsenate of soda was found sufficient to destroy the swarm entirely. The poison was mixed with four pounds of brown sugar (panola) and this dissolved in a large vessel with hot water, cold water being immediately added in a quantity sufficient to make forty-five pounds of solution. Six bunches of green barley, weighing about thirty-six pounds, were soaked in the arsenic solution for from fifteen to twenty minutes, so that the fodder was thoroughly saturated.

"The advance of the locusts was checked somewhat by flaunting cloths, flags, etc., in front of the van. At the same time the poison was distributed in small quantities among the pests in rows ten feet apart, a small portion being cast about every four feet in the rows. By this means the poison was spread among the greater part of the swarm.

"The first effects of the poison were to restrain the advance, it being no longer necessary to resort to the original tactics, i. e., the flaunting of flags, etc. The locusts attacked the poisoned fodder voraciously, each spike of grain killing hundreds. Of those that ate, the few that, the following morning, had not succumbed had the appearance of being intoxicated, and were quickly disposed of by beating with sprigs dipped into what remained (about two-thirds) of the solution.

"Care was taken to gather the rest of the poisoned barley which the locusts had failed to devour. On the following day about one-third of the original flock had succumbed to the poison. The survivors fed upon the dead ones, and from this on their destruction was effected automatically, there being no further necessity for spreading the poison. In about four days the elimination of this great swarm of locusts was complete.

"It is worthy of note that the birds which fed upon the poisoned locusts showed no signs of having been affected. The work of destruction was simple, and the only material cost involved was the work of four persons for two hours. From the moment the foremost of the swarm began to take the poison the advance of the entire swarm was checked, and the unaffected showed no disposition to advance farther."—Harpers.

POWER ON THE FARM

There is a rapidly growing demand for a satisfactory power for use on the farm. In many places windmills have been arranged so that they not only pump water, but do other valuable service; but ofttimes when they are most wanted there is no wind, and many farmers have put in small gasoline engines to pump their water, the original expense not being much larger than a windmill and they are always ready for service and can be used for other work as well.

It has been discovered, however, that when a farmer puts in a machine, he immediately begins to see other ways in which he can use it and that most of such ways require a great deal more power than the engine which he thought was large enough for his needs will furnish. He finds that he can make a decided saving both in money and in time by grinding feed for his stock; that he can use the power for shelling corn or for sawing wood; and that for these purposes a power of from five to eight horse-power is needed, and with the larger size mentioned, he can cut and fill his silo by using a small ensilage cutter and a feed carrier. But if he wants to fill his silo to the best possible advantage in saving of time and labor, with a blower attachment for which he will want from twelve to fifteen horse-power, he will then require a larger machine.

We would advise every farmer keeping any quantity of stock and seeing the necessity for a power plant, to purchase not less than a five horse power gasoline engine of some make, backed by a concern in which the purchaser can have confidence. There is no more annoying machine that can be purchased than a gasoline engine on a farm. It is worse than a balky horse, for you usually have another horse at hand or can borrow one that can do the work. On the other hand, thousands of farmers without any mechanical training are running gasoline engines successfully and would not think of running the farm again without it. Get a good engine that is large enough for your needs.—Dakota Farmer.

UNBURNT LIME FOR SOILS.

It is not well to condemn a practice which some one may have suggested after a single trial. The value of government farm experiments lies in the fact that they are exhaustive. For instance, it is often said that the practice of liming soils with unburned lime rock is a waste of energy. It may be or it may not, according to varying conditions. These same Jersey experiments showed that on sandy soils ground unburned lime gave better results than burned and slaked lime. One-half ton per acre of finely ground oyster shells (unburned) gave a good increased yield in sandy soil and was entirely without effect on heavy, clay soil. On sandy soil lime should be applied less frequently and in smaller dressings than on heavy soils; nevertheless it may be of the utmost importance to apply it to insure maximum crops.

Following the testing method employed by the Bureau of Soils of the Department of Agriculture, the Florida Station determined that an application of ground limestone (unburned) doubled the yield of "beggar-weed," the legume which shares with the cowpea the honor of being termed the "clover" of Florida. Soil which was fertile but undoubtedly deficient in lime was taken for the experiment and the plants and roots on the limed soil not only yielded double the weight of those grown on the unlimed soil but it was noticeable that

This quick-firing "three-shot" gun is the handiest and most up-to-date article ever made in the shot-gun line. It's yours for **$8.00**

Sent by express, prepaid, to any address in the United States, upon receipt of price. Absolute satisfaction and safe delivery guaranteed.

The HOPKINS & ALLEN "Three-Shot" Gun

is unequalled for quick shooting. The three shots, one in the gun and two in the clip, can be fired with the rapidity of a repeater. No more missing good shots because your ammunition isn't with your gun. There are always two shells in the clip. No need of keeping a loaded gun in the house—a shell is slipped into the breech at a second's notice. Your gun is always ready for a shot at hawk or game, and you don't have to hunt for shells while the game gets away.

You were never offered a gun as good as this for the price.

Fine decarbonized steel barrels bored full choke for close shooting and deep penetration. Frame case-hardened. Stock and fore-end fine walnut. Top snap action, locks automatically, and joint takes up its own wear. Rebounding hammer, rests in safety notch after firing, eliminating danger of accidental discharge. Hard rubber butt plate. This gun is guaranteed to shoot factory-loaded nitro powder shells. 30 or 32 inch barrels. Automatic ejectors.

1908 GUN GUIDE, FREE!

Our Gun Guide and Catalog for 1908 describes in full 11 styles of double guns, 8 styles of singles, 10 styles of rifles and innumerable kinds of revolvers. Gives lowest prices and offers most complete line. No sportsman or gun lover should be without it. Write for it now.

300,000 Feet Water Pipe Cheap

ALL SIZES

150,000 feet of this shipment is second-hand pipe, practically as good as new, and is now on sale at a big discount by the Adams Pipe Works, 2025 Bay street. Sizes and prices: ¾-inch 2 cents per foot; ⅜-inch, 2 cents per foot; ½-inch, 2¼ cents per foot; ¾-inch, 3 cents per foot, 1-inch, 4¾ cents per foot; 1¼-inch, 6 cents per foot; 1½-inch, 7 cents per foot; 2-inch, 9¾ cents per foot; 2½-inch, 15 cents per foot; 3-inch, 19 cents per foot; 3½-inch, 24½ cents per foot; 4-inch, 30 cents per foot.

Oil well casing prices and sizes: 2-inch. O. D. 7 cents per foot; 2-inch, I. D. 9 cents per foot; 3-inch, 13½ cents per foot; 3¼-inch, 16 cents per foot; 3½-inch, 17 cents per foot; 4-inch, 20 cents per foot. All pipe is carefully inspected, new couplings and new thread are put on every piece, every joint is guaranteed to be first class, serviceable pipe. Mail orders promptly filled. To reach the Adams Pipe Works in Los Angeles, take car marked Pacific Boulevard, starting east on Seventh street from Broadway. Ask conductor to let you off at Bay street and go east half a block. Phones, F1917, Broadway 1264.

EUCALYPTUS

Balled in moss and leaf mold. All the roots saved. None sent out too small to plant. Sample lot of 100 in flats, tops protected, $1.60.

Henry Shaw
320 River St. Santa Cruz, Cal.

When writing advertisers, mention Cultivator.

the plants receiving no limestone were almost devoid of nitrogen-gathering nodules, while those treated with lime were fairly well supplied with them. It is stated that it had been the prevailing opinion among a large class of Florida farmers that no benefit could be expected from the application of lime to soil unless the lime was burned. Lime has been shown beyond question to improve soils—i. e., induce greater crop yields—not so much by directly feeding the plant as by unlocking plant food in the soil.

DRY FARMING CONGRESS.

The growth of the trans-Missouri Dry Farming Congress in three years, from a somewhat local movement among Colorado "dry farmers" to a great international congress in which representatives of millions of acres of lands in the arid districts of the world are working together to study the problems confronting the "arid land" farmer, is one of the interesting developments of the year. Hon. Elihu Root, Secretary of State, has just issued letters from the State Department, inviting the ambassadors and ministers of all nations represented in Washington to participate in the coming third congress of the dry farmers, and all nations having districts where the natural rainfall is slight and where irrigation is impossible, will be urged to send delegates to attend the congress and to study there the methods advocated by the western farmers, who have been mastering the problems and have already "made good."

The third congress will open in Cheyenne, Wyo., February 23 next, and will continue three days.

Already Algeria, Turkey, Turkestan, Russia, Australia, New Zealand and Mexico have joined the congress, the memberships being in the names of the agricultural secretaries, and these countries will probably make a special effort to place reports before the congress and to discuss their neeeds and conditions. Australia recently sent Commissioner Strawbridge of the Department of Agriculture and Senator James McCall as agents for the government to study western conditions and the so-called "dry farming" methods in practice. They have just issued a 100-page report showing the conclusions reached after comparing American conditions with those in Australia.

WHAT FERTILIZERS ARE WORTH.

The real and relative value of one ton each of several fertilizers is given by the Illinois College of Agriculture:

A ton of fresh farm manure contains ten pounds of nitrogen, two pounds of phosphorous and ten pounds of potassium, with a total value of $2.34.

Of dried blood, 280 pounds of nitrogen, worth $42.

Of sodium nitrate, 310 pounds of nitrogen, worth $46.50.

Of ammonium sulphate, 400 pounds of nitrogen, valued at $60.

Of raw bone meal, eighty pounds of nitrogen and 180 pounds of phosphorous, worth in all $33.60.

Of steamed bone meal, twenty pounds of nitrogen and 140 pounds of phosphorous, worth $33.

Of acidulated bone meal, forty pounds of nitrogen and 140 pounds of phosphorous, worth $22.80.

Of slag phosphate, 160 pounds of phosphorous, worth $19.20.

Of rock phosphate, 250 pounds of phosphorous, worth $30.

Of acid phosphate, 125 pounds of phosphorous, valued at $15.

Of potassium chloride (muriate of potash) 840 pounds of potassium, worth $50.40.

Of potassium sulphate (sulphate of potash) 800 pounds of potassium, worth $48.

Of kainit, 200 pounds of potassium, worth $12.

Of wood ashes (unbleached) ten pounds of phosphorous and 100 pounds of potassium, worth $7.20.

SOWING ALFALFA.

Just before sowing there should be scattered over the land broadcast, or drilled in with a grain drill, two or three hundred pounds of inoculated soil. This soil may be taken from an old alfalfa field, or since sweet clover, or what is commonly known as "bee clover," has the same bacteria on its roots as alfalfa, soil taken from around these plants will answer. If this is broadcasted it should be harrowed just as fast as it is scattered since the light kills the bacteria.

The seed should be of strong vitality and free from obnoxious weeds. It should be sown at the rate of from 15 to 20 pounds per acre, depending upon its quality and the character of the seed bed. It should either be put in with the seed attachment of the grain drill, allowing the hoes to cover it lightly, or if broadcasted it should be sown half one direction and half the other, as this gives more uniform distribution. It should be harrowed in lightly, covering the bulk of the seed from one-fourth to one-half inch deep.

WEBER'S MOVED.

If any man in California understands the needs and requirements of the dairymen or the creamerymen and knows how to meet those needs it is Mr. Weber of the O. J. Weber Company. For 20 years Mr. Weber has been engaged in catering to this trade with Los Angeles as his base of operations. For many years he was connected with the G. G. Wickson Dairy and Cream-ery Supply Company as the manager of its Southern California House. For years he was secretary of the Creamery also of the Milk Board of Trade. These positions gave him such a prestige that when he severed his connection with the Wickson Company and established the O. J. Weber Company 557 South Los Angeles Street, those who knew him readily predicted that things would be doing along his line in the near future. This was soon proved to be true for within a year after the establishment of that house the store room space was doubled by the tearing of a hole through the wall into the next room and the addition of several car loads of creamery supply stock. These two rooms had to suffice for the growing company until the end of December when the walls of that establishment could be bulged no more and new quarters had to be secured. New rooms especially constructed for the business were located on the corner of East 6th and Maple Avenue. These large rooms especially fitted for this work enable the better arrangement of the stock and with large sky lights give one of the best fitted rooms for this line of implements of any on the Pacific Coast.

The new quarters are well worth a visit on the part of dairymen or creamerymen.

PRUNING DECIDUOUS TREES.

Continued from Page 31.

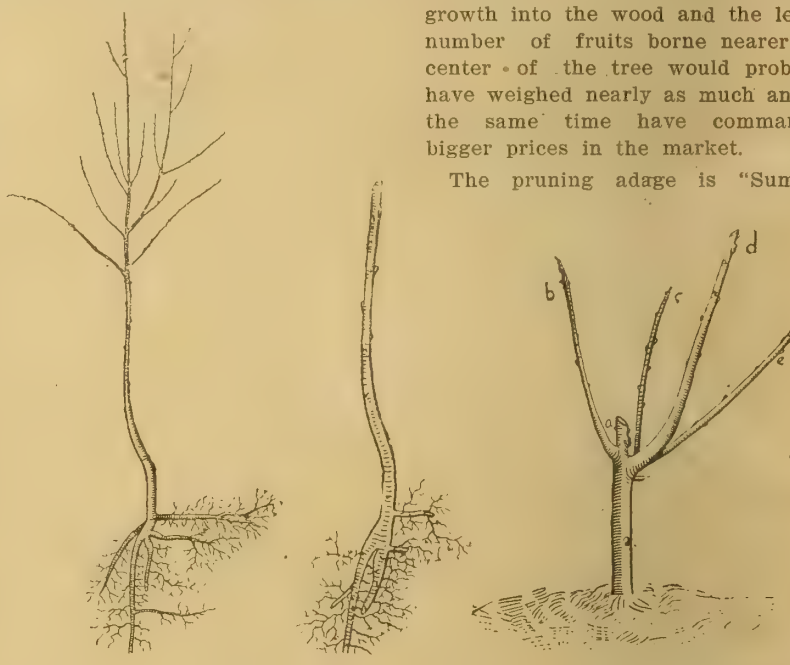
more sunshine to the center of the tree. Variations from these rules will of course be followed as may be necessary to make a limb grow sideways, inwards or outwards in order to make it more properly balance the tree while other limbs on the same tree may have followed the general rule.

Older Trees.

Where one comes into possession of an orchard which has been neglected for several years, then the saw or chisel has to be called into requisition and what is sometimes called "tree butchery" has to be indulged in.

Tools.

A word as to tools at this point may be in order. As we noted in the beginning, the thumb and finger are the most valuable factors in pruning. Others assert that the small pocket knife is the only tool which should ever be used in the orchard. These extreme statements may be used to convey the information that greater care should be taken to remove objectionable limbs when they are small. But such careful work being so seldom done, other tools are necessary.



Original Tree as Pruned for Setting Too Long and Carless Pruning.

At least three should be part of every pruner's kit; a good stout knife, or some prefer the bill hook; a well built pair of pruning shears which will hold an edge, and, lastly, a good saw. The knife should be a good knife that will hold an edge and may pass at that. The hand shears cannot be too well made. At best they are often exasperating. The very best of framework should be had which permits of the blade being exchanged and a new one inserted when the old one wears down.

Of saws, like the shears, there are all kinds. The preference usually is for the ordinary small saw, which make the cut while pushing. Other pruners prefer the semi-circular saw, or, rather, one which has a strong curve to it which makes the cut while drawing toward the pruner. This is much less liable to breakage. In any case, it must make a clean, fairly smooth cut. In old orchards which have been neglected and many tangled limbs left massed together, a very desirable tool is the mallet and chisel. This will remove limbs sometimes so situated that the saw will not reach them at all, and also leaves an exceptionally smooth cut, which is a factor in quick healing wounds. Another convenient tool, in fact, almost a necessary one with large trees which require topping or heading in, is the pole pruner, or shears at the end of a long pole and operated with a wire running down to the handle. With these a large tree can be headed in vastly quicker time than by attempting to do it from the top of a tall ladder.

The Older Trees.

After the third year's pruning and the trees are ready for bearing, heading in or allowing the branches to grow at full length depends upon variety and upon climatic conditions. With the strong growth in California heading in with some trees is essential. We have seen prune trees bent out of all semblance to a tree by a big crop which came at the ends of long, slender limbs. Peach trees have borne themselves to death, or borne their vitality away and been blown to pieces also by the same kind of management. A little judicious topping would have thrown more vigorous growth into the wood and the lesser number of fruits borne nearer the center of the tree would probably have weighed nearly as much and at the same time have commanded bigger prices in the market.

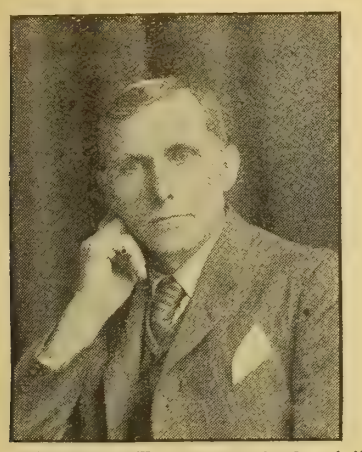
The pruning adage is "Summer pruning for fruit, winter pruning for wood." Apricot growers as a rule believe in the summer pruning. This is done as soon as the fruit is removed. Heavy topping of the trees causes strong growth of young shoots which fill with fruit buds giving a good crop the coming year. Heavy irrigation is usually given immediately after pruning. Peaches are less often summer topped, but strong cutting in is advisable at the winter pruning. Old peach trees which have ceased to bear heavy crops may sometimes be renewed by cutting back severely during winter.

Painting Wounds.

Decaying spots or knots in the center of the trees are disastrous to the health of any tree. These can be avoided if proper pruning is done. The cut, whether it be with saw or chisel, should be smooth and as near the trunk or main limb as possible, or as the pruner will tell you, "saw it off just at the collar." This is not so close to the trunk of the tree as to make an exceptionally large wound; neither is it so far away that the projecting stem will die back and ultimately decay. After the cut is made the wound should be covered with something which will act as an antiseptic which will prevent the growth of any fungus on the exposed surface and at the same time prevent the weathering or checking of the cut surface. The ordinary grafting wax treated and applied to these wounds has usually been preferred. Some claim, however, that the ordinary lead and oil is the best of any covering for tree wounds. Tar has been used, but is found objectionable.

No Overproduction of Fine Rhubarb

"NO sir, I do not believe it is possible to plant sufficient rhubarb to supply the market with what it really wants, to say nothing of producing to the extent of over production. Furthermore I do not believe there will be any necessity of 'creating' a demand for this product of which we are producing altogether too limited amount. You have only to consider the great demand which there must necessarily be for such an excellent product and the limited field in which it does well. Crimson Winter Rhubarb is produced successfully in only a very small section of California. Florida and other southern states have tried it but with such indifferent success that it will probably not succeed there. This is probably due to the low swampy nature of the ground which at times has too much rainfall to admit of good drainage. Therefore in answer to your question as to the possibility of over production, I must answer emphatically, 'there is none.'"



J. B. Wagner, The Rhubarb Specialist.

Note the size of the stalk of Barb in Mr. Wagner's hand. It is larger than his wrist. Other stalks on growing plants are nearly as large.

The above statement was made by J. B. Wagner, the rhubarb King of Pasadena in answer to a query. And from all that he says and from points we have learned of packing houses already being built and car loads being forwarded of his products it certainly looks good to consider the great possibilities for the future.

A Car a Day.

One of the large fruit buyers of California has stated that the city of Los Angeles alone will consume of this product at least a car a day through the winter season, this in face of the fact of an abundance of oranges and other cheap fruits all the winter through. Eastern consumption should be proportionally vastly in excess of that of California.

The Phalanx Company which is at present engaged in opening the market with Philadelphia as the center, writes most encouragingly regarding the outlook in Philadelphia. The few shipments which have been made were a complete success though they were considered more in the nature of a part of the advertising campaign than as real commercial shipments. This concern now has its packing house ready for work at Pomona and running to it are spurs from both the Salt Lake and Southern Pacific Railroad. This concern expects in the near future to supplement this packing house with a cannery and possibly a winery at which the cull product may be worked up into a product which will command the top of the market. By this means every stick of the rhubarb which may be pulled will be used in some way. On this point of goods for attracting the eastern buyer, Mr. Shoemaker writes to Mr. Wagner after a few months experience in developing the city market,

Shoemaker Says.

"A reputation for quality is being established, which is the one essential thing to be maintained to keep Crimson Winter Rhubarb in the fruit class.

"Any inferior product sent to the market at this time will kill it. This is the thing to be guarded. The industry is in its infancy and the great danger is that some over zealous growers may try to put an inferior quality on the eastern market.

"After its proper culture is thoroughly understood, this danger will lessen. We must therefore help this infant, until it can walk, and protect it from this danger."

Mr. Shoemaker says further: "There are many ways of growing it, but only one right way, which is in accord with your published methods. There is only one right way to pick it and market it, which is in accordance with the methods we have found out by practical experimentation.

"We have determined this year to ship from our own plantations only that which is right for the eastern market, and we shall expect others to do likewise."

Just Pride.

Mr. Wagner takes great pride in the development of the product to which he has given so much thought and hard work during the past few years. From the modest start which he made with it seven years ago he has today thousands and even hundreds of thousands of these small plants ready for sale. Besides his interest in a commercial way, there is a satisfaction in seeing the working out of this product to such complete success which is a matter of great pride with him. His own efforts have been so largely taken up with selecting, hybridizing and working up a tablished as yet very small plantations. But it is a pleasure to him to know that men like Messrs. Maxewell of Downey, Harris of Norwalk, Teel of Santa Ana, Bryant of Pomona, Loftus of Monrovia, Kopp of Burbank, Lee of Covina, Hollister of Chino, Hayward of Thermal and Lawson of San Jose are finding both pleasure and profit in the culture of this fruit.

Rhubarb is Not All.

In speaking at such length of Mr. Wagner's great success with the rhubarb, it should not be imagined that this is his only work, although his principal one. He is engaged in the introduction and breeding up of the Udo Japanese salad more perfect plant that he has for himself esplant, also of several hybrid walnuts of his own creation and several other features, which to the ordinary person causes wonderment that he is able to command the time to give attention to so many different lines of his work at the same time.

Recognition.

As a recognition of his great work, Mr Wagner has been awarded a gold medal at the Portland Exposition 1905, and his products secured the highest award at the Jamestown Exposition 1907. Of course at the state fair he always takes everything in sight which is takable. We may add also that his public spirit in this matter is shown in that for the last two fairs Mr. Wagner has offered special premiums on Crimson Winter Rhubarb whether the same was grown from plants purchased from his grounds or not.

He announces that from this time forward he will offer prizes at the future state fair which will aggregate over $100 in value.

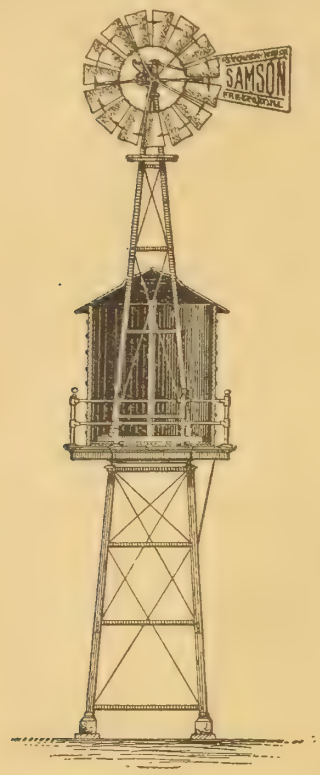
In the matter of the amount of stock which he has and prices, information may be had by writing him at Pasadena, but it may be a matter of general interest to know that his best bred plants of the first size he is selling at 35 cents each, $2 per dozen or $50 per thousand; the next size at $40 per thousand, special prices in large lots, and still smaller plants at still lower prices which also give excellent results but of course require closer attention for the first few months after planting.

Parties anticipating extensive planting will do well to call on or correspond with Mr. Wagner for further information.

Crimson Winter Rhubarb.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Grape Pomace

IN response to your request for a statement on the value of grape pomace for fertilizing purposes, I extract from the Report of this Station for 1898-1901, page 261, the following data:

GRAPE POMACE (fresh.)	Per cent.
Water	55.00
	Lbs. per ton.
Potash	16.60
Phosphoric acid	5.00
Nitrogen	17.50
Valuation, per ton	$2.66

GRAPE POMACE (Old.)	Per cent.
Water	21.00
	Lbs. per ton.
Potash	21.40
Phosphoric acid	17.90
Nitrogen	33.60
Valuation, per ton	5.19

MIXED BARNYARD MANURE.	Per cent.
Water	75.00
	Lbs. per ton.
Potash	11.40
Phosphoric acid	6.00
Nitrogen	11.40
Valuation ,per ton	$1.95

You will perceive there is a very great difference between the values of the fresh and the old grape pomace; due, of course, to some extent, to the higher content of water in the fresh. But making allowance for that, it still appears that there is a concentration of the phosphoric acid and nitrogen in the old pomace, while some of the potash has evidently been leached out. This does not necessarily mean, however, that these ingredients are as available in the old pomace as in the new, in which we know them to be in a very available condition. In other words, the old grape pomace would probably not act as a fertilizer as quickly as the fresh, but its effects would spread over several years, while the effect of the fresh would be more immediate. Weight for weight, as you perceive, both kinds of pomace are superior to mixed barnyard manure with 75 per cent. of water. If, however, you make allowance for the difference in the water content, reducing the water content of the stable manure, say to that of the fresh pomace, you perceive that the difference will not only be much less, but rather in favor of the stable manure. In addition, we know that the ingredients of the stable manure are in a rather readily available condition.

From the basis of these data, any one can calculate for himself how well it will pay him to use these several materials. You perceive the total value of the old grape pomace is about twice and a half that of the barnyard manure, and practically double that of the fresh.

As regards the amount to be applied, old pomace could not easily be overdone any more than stable manure, even if several tons are used per acre. There will, in fact, be less danger of the nitrogen of the pomace producing an excessively brash growth because of the more or less humified form of the nitrogen. In the fresh pomace the content could be more easily overdone, and in land not rich in lime the tartaric acid present might, for a time, bring about a little inconvenience; but in nearly all the valley soils of Southern California there is such an abundance of lime that the tartaric acid would be neutralized and then decomposed, just as is the citric acid of the orange culls when plowed in. There are but few lands I know in Southern California in which the tartaric acid would be likely to create any inconvenience, even for a short time.

Considering the considerable loss of potash by leaching of the old pomace, there would seem to be economy in applying the fresh wherever the difference in weight, and consequent cost of hauling, will not be too great. There seems, however, to be but little loss of nitrogen and apparently none of phosphoric acid in the old pomace as compared with the new. Certainly neither of the two products should be allowed to go to waste; and, of course, it must be remembered that it makes a difference whether the pomace after pressing remains in big piles, or is spread out rather evenly. From big piles doubtless some nitrogen would escape in the form of ammonia, but when spread about, whether near the winery or in the field, there would be little loss of practical importance in allowing the weight of the material to diminish so as to decrease cost of hauling.—E. W. Hilgard, Berkeley, California.

MANURING THE ORCHARD.

As a rule, men rob an orchard of its fertility with less compunction than is felt when the same kind of soil robbery is carried out in the open field. Because the roots of trees penetrate the soil deeply, the idea is conveyed that an inexhaustible supply of fertility must be tapped. As a result of this belief it is not uncommon to find instances where orchards are allowed to remain for years without any applications of fertility whatever, and in the meantime they are producing fruit and in all probability being pastured.

In their work on American horticulture, Budd and Hansen call attention to the fact that after an orchard has borne repeated crops and after the trees are too large to justify sowing catch crops the free use of barnyard manure is advisable at least once in four years. The term "fertilizer sick" has come into use owing to the fact that in the East and in the South commercial fertilizers are used only, which results eventually in bringing the soil into an unproductive condition on account of the lack of humus. This is the material that is supplied by farmyard manure that is of the greatest value. although, of course, plant food elements are also contained in the manure and these find their way into the soil after surface dressing. ,

There is nothing that is more healthful to an old orchard than a liberal application of farmyard manure. An instance comes to our mind where a row of old Genitan apple trees were showing signs of decay at the top and the fruit produced on these trees was very small and very scabby. A rather heavy application of farmyard manure was made three years ago last spring, and as a result the trees are looking much fresher and last year's crop was very readily marketable. The apples were large for this variety and they were smooth.

In another case the same treatment was applied to some old Snow apple trees, and the result was even more striking in this instance. The fruit has been much better each year since the application than it was before.

If an attempt is made to manure the orchard it is advisable to spread it over the entire surface of the orchard; that is, between the trees as well as under the trees. If the supply of manure is limited, however, then make the application under the trees. There is no special advantage in applying it near the trunk, as better results will be obtained from a given amount of manure by covering a circular patch under each tree, having the outer circumference of the circle just about as large as the outer branches and leaving a strip six or eight feet in diameter in the center of the tree without manure. Of course we would advise not being too economical if there is plenty of manure available, because it should be remembered that some of the feeding roots even go out beyond the branches of the trees.

We prefer a moderate application every three or four years to a heavy one at longer intervals. It will be better for the trees and more uniform fruit yields will be obtained.—Iowa Homestead.

Orchardists of Colorado in a recent state convention discussed the matter of orchard heaters or frost protectors for use in their orchards during the early blooming season.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Uusigned communications receive no attention.

Pecans.

Regarding the query as to pecans growing in Riverside which was answered last week, further answer is received from Mr. Leonard Coates of Morganhill, who writes that he thinks pecan trees will do well in the river bottom lands near Riverside. He adds: "It is impossible to say which of the improved varieties would do best. It might be well to plant seedlings with the idea of grafting later on. We have two year old seedlings which we sell at $10 per hundred."

Small Guavas.

I have a number of guava bushes that have plenty of fruit, but it is very small. I have used plenty of fertilizer from the horses but cannot increase the size of the fruit. Will you kindly advise me what I should do? What do you think the trouble is? —"Subscriber," San Diego.

Your guavas are probably seedlings and of a variety which will not grow large, because the treatment you seem to be giving should be sufficient to give all the size of which any particular variety is capable. We presume your only remedy is to graft the bushes to some variety of known value. Under right conditions, especially in a glass house, you can reproduce the guava from cuttings. This would be preferable to the ordinary seedlings.

Orange Tree in Poor Condition.

Three years ago I planted two orange trees. Have made fine trees but, though growing vigorously, fruit is very small. There is no lack of water and they have been well fertilized. Am I allowing too many oranges? There are about three dozen on each tree. There is much bloom. Shall I thin the young fruit? No scale.—F. R., Ventura.

It is hard to answer with any definiteness, though two points you mention, that there has been no lack of water and that there is much bloom, may indicate you have given too much water. In any case trees showing bloom at this period of the year are out of condition, for it is yet too early by nearly three months for them to be showing any bloom. We imagine your trees may be on a lawn or where they have not had thorough culture. If so you will never be able to grow the best of fruit. If where they may be spaded up, give thorough and deep culture to admit the air to the soil which is probably soured and is not in good condition for orange roots. Oranges require warm, well tilled soil. Do not water too often. Once every 30 days unless on very dry, hot soil, is plenty often enough and even then only during the summer season and when necessary.

Caps for Alfalfa.

I saw in the Cultivator some time ago an article regarding use of caps for alfalfa. What is material and where can it be obtained?—A. H., Salida.

Caps have not been used to any extent in California, hence have not become a factor in the trade. In the east they are used largely to keep the curing hay from the moisture and from the sun. The material is fairly heavyweight muslin. These caps after being placed over the cock are held in place with pegs at each corner. While necessary in the rain belt we hardly think California conditions would justify this extra expense. However, as the night dews and fogs of some sections are very injurious to curing alfalfa the farmer who takes pride in a perfect article might find profit in this additional care. It must be borne in mind that alfalfa has practically the same feeding value, ton for ton, as does good wheat bran, so that it is well worth careful curing.

Scale.

Please explain what is best thing to do for scale on plum trees.—F. W., Santa Ana.

This depends somewhat on the variety of scale. If it is the San Jose scale, the best wash ever tried is the old sulphur, lime and salt solution, which is however very difficult to mix unless one is prepared for it. As this pest is not very serious now it is probable your trouble is from soft or black scale, either of which may be readily reached with the distillate emulsion or mixture. On the dormant trees you may apply almost any strength. Some however, prefer the coal oil mixture which may be applied at the rate of one gallon of coal oil to nine gallons of water, all to be most thoroughly agitated at the time of application.

Oranges in Imperial.

Will you kindly advise me as to oranges in Imperial valley? Will they color here as early as in other districts? Is the fruit of good size? Also will grapefruit do well here?—H. D., El Centro.

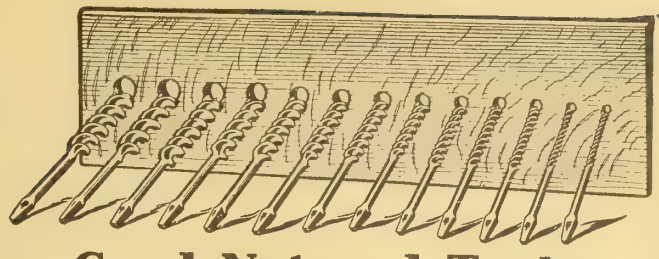
Oranges have been tried in many sections of Imperial valley and many are enthusiastically supporting the extension of the plantings. They will color up earlier than in most any other section of the state. In fact, fully as early as in Arizona, and probably earlier than in Tulare county. They should grow to good size. As to grapefruit we have not heard of its being tested there but think without question it would not prove so satisfactory as the early orange. California grapefruit has not commanded the prices in eastern markets which Florida fruit has.

The Weather Bureau reports that the temperature at Brawley was but little below 30 degrees at the coldest this season.

Thornless Cactus.

I have noticed much advertising of the spineless cactus or opuntias and would like to ask: (1) Are they good fodder for stock and do they take the place of pumpkins and will hogs fatten on them? (2) How fast will they grow? (3) If planted in rows how far apart should rows be? (4) How long do plants live when leaves are kept cut for feeding? (5) At what age do they bear fruit? (6) How is the fruit served? (7) Will they grow on most any kind of good soil? (8) When is the best time to set out cuttings? (9) Should cuttings be kept watered? —H. E. T., Santa Paula.

The so-called spineless cactus is wrongly named in that we believe none of it is strictly spineless. It would be more correctly called thornless cactus. The spines are so reduced in the leaf, however, that stock



Good Natured Tools

It is not necessary to *force* Keen Kutter Tools. Keen Kutter bits, for example, work quickly and easily in any kind of wood. Lips are long, strong and perfectly tempered, adding years to the life of the tool.

Keen Kutter Tools like hard work. The edged tools never lose their temper—handled tools never work loose or fly off—hammering tools keep their faces straight.

find it excellent feed. The fruit is very spiny and the best method of preparing so that it may be handled is to pour water over it, place in a colander and shake it about, when its spines are removed so that it may be handled very comfortably. (1) On waste land where it is impossible to grow other crops it is very probable the cactus will prove a profitable crop. It will not for a moment take the place of pumpkins and we have not heard of its being tried as a hog fattener and do not think it would be satisfactory for that purpose, although it might be a good food for the growing pigs. (2) On good soil where they have received irrigation, the first season they have produced four leaves to each plant. After being established it is probable more extended growth would be given if not kept cut too close. (3) Plant in rows 8 feet apart, 6 feet in the row. Where leaves are cut closely, it is possible closer setting than this would be wise, but at that distance it makes nearly 1000 plants to the acre, which, at the $2 per plant which a company is charging for the plants, would necessitate nearly a $2000 planting expense per acre. We are told, however, that this spring one of the largest seed houses of Los Angeles will have abundance of plants at 35 cents. (4) We do not know how long lived the plants will be, but assume they will live for a great many years. (5) It will bear fruit the second year. (6) The fruit may be served as noted above by pouring water over the fruit and shaking around in the colander so that the spines may be largely removed and it may be handled and peeled. It is then eaten fresh or some make a fairly satisfactory jelly. (7) If you desire to give up fairly good soil to the production of this plant it will doubtless grow well. (8) The best time for planting is May or June. (9) Cuttings should not be watered until they have taken root or there is danger of rotting.

Injured Tomatoes.

What ingredient must be returned to the soil after a crop of tomatoes to plant again to the same crop? What, if any, value is air slaked lime to the soil? What can you afford to pay for it by the barrel or ton? What is the proper course to take with tomato plants partly frozen down? How much, if any, should they be cut back and can they be profitably carried over to spring after being frosted?—A Subscriber, San Diego.

I am not sure that any one has definitely determined just what particular ingredient may be returned to the soil that has grown a crop of tomatoes in order to insure another crop on the same ground. It would be worth a good deal to know. Experienced gardeners rarely try to grow successive crops of tomatoes on the same soil—finding it safer to change to other crops for a year or two. I do not assert it is impossible, but the chances are against success. If I were obliged to use the same land twice in succession for tomatoes, I would have more faith in a liberal dressing of stable manure than the application of some special fertilizer.

Whether lime has any value, used in the manner indicated, depends. In itself it is not a fertilizer as that term is ordinarily used. Although classed as a plant food, plants will live and thrive without it. But it has great value in its chemical action in decomposing vegetable matter and rendering it available as plant food. I was brought up in Pennsylvania where the fertility of the farms was largely maintained by the use of lime—although it seemed to be a roundabout way. A sod was plowed under any time between November and April and lime spread broadcast at the rate of from 100 to 400 bushels per acre and harrowed in and the ground planted to corn. The action of the lime decomposed the sod and gave the corn crop an enormous supply of humus. It was the usual custom to follow the corn crop with oats and the oats with wheat in the fall, seeding down to grass at the same time. The application of lime to a soil deficient in vegetable matter will make it lifeless and unproductive.

It seems to be generally conceded that California soils have all the lime any crop is likely to need. I know of no experiments having been made here that would enable any one to say what one could afford to pay. It would be interesting to try an experiment in a small way in connection with a liberal supply of stable manure.

The tomato plants partly frozen should be cut back to the uninjured portion. Whether they can be profitably carried over will depend largely upon the season. Sometimes the injury from frost is so great that they fail to recover their usual vigor when spring comes, in which case it is better to depend on new plants.—Q. A. L.

Pruning.

Please give hints on pruning, such as starting young trees as well as pruning old ones. I am well pleased with the Cultivator.—I. T. S., Fortuna.

This question is answered in the first-page article of the Cultivator this week more fully than could be done in this department.

Pruning Olives.

Kindly give information regarding the pruning of olive trees as to time and method. Should they be topped or allowed to grow as high as they will?—Mrs. P., San Jose.

The olive tree should be headed at planting low enough so that the fruit should not be up out of reach at time of picking. The natural tendency of the tree is to grow too high unless topped when young. The main stem should not be over about four feet, and this should support six or eight branches, which may be left to form the head. Ordinarily the cutting consists in removing the leader and fostering the spreading habit. Care must be taken that the tree does not thicken up too much so as to exclude the sunlight. When the tree reaches bearing age you must remember that no fruit of the olive ever grows excepting upon wood which was formed the preceding year. Therefore the continual practice must be to secure abundance of thrifty young growth. From the present time on to nearly blossoming time is the best season of the year for pruning. In sections where there is danger of January or early February frosts, it might be well to defer the pruning so that the young growth, which may be stimulated by the cutting of the trees, will not be out in time to be caught by the frosts.

Almond Growing.

We wish to grow our own almond trees in the nursery, and wish to ask your advice as to planting almonds and budding peaches and plums. Do almonds make a good stock, and what is the best variety of almonds to plant for nursery stock?—L. T., Newcastle.

For the stock it is not so material as to variety as it is that the seed shall come from a strong growing, thrifty tree which will give you a large, perfect nut. The almond stock is considered exceptionally good for peaches. As for plums, some varieties do well, some do not. The French prune succeeds admirably with the almond as root stock or when grafted into the tops of old trees. It should only be used on warm, well drained soils.

Seedling Walnuts.

I have just bought an orchard of thrifty three-year-old walnut trees, selected seedlings. Will it be better to graft them at once to blight resistant trees or to wait until they bear and graft only those that suffer most from blight? The orchards are in the El Monte-Covina district.—P. C., Long Beach.

We would surely defer grafting until this orchard can be tested. Having had three years' growth, you will soon be able to determine regarding the value of many of the trees. If you are able at this time to get thoroughly blight resistant scions it might possibly be wiser to graft at once, but you may develop in your own orchard trees which will be equal if not superior to any which you may find in the country at this time. The search for just such trees as you would wish is being made in every corner, and the one entirely satisfactory has not yet been found.

China Hogs.

Can any of your subscribers inform me where I can get thoroughbred Black China hogs?—J. H. I., Laton.

If our subscriber means the well-known black breed, Poland-China,

they may be had in every section of California. This is one of the best breeds for this state. We do not know of any breed which is called the Black China, however. Can any of our readers give us information?

Transplanting Willows.

I wish to be informed whether I can transplant the common or Grey Willow after it has attained a height of twenty or twenty-five feet, and if so, how it should be done.

Also please give instructions for taking cuttings from Purple Damascus grape vines. The vines were set out last March. They were rooted cuttings. Should they be pruned down close?—H. J. B., Calexico.

The Grey Willow can be transplanted by trimming back all but a few of the main branches, so as to maintain the shape of the top. Dig it up with several of the main roots three or four feet long and keep the ground well wet when it is transplanted. Do not let the top or roots dry out in the least.

Make your Purple Damascus cutting about six inches long, tie in bundles of about 100 and bury, put ends up and put four inches of sand over them and keep it moist. Examine occasionally and when they commence to callous plant them in the nursery row, straight up and down. Have the land moist and soft so as to admit of their being pushed into the soft earth without brusing the callous. While planting keep the cuttings under a wet sack and on some soft moist earth in the box. As soon as a bundle is planted in this way, cover them up clear to the top bud and settle with water within 24 hours. Cuttings planted in this way are most economically placed in a partly filled furrow so that the tops of the cuttings come even with the surface of the ground.

It is not generally known that Purple Damascus is a hard variety to root compared with Malagas. Cuttings of this variety should never be planted in vineyard form for this reason. If you get 60 per cent of the cuttings to grow you will do well.—J. W. Mills.

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are preferred they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper only, no charge is made if the answer will be of general interest.

Please address all questions that are to receive gratuitous replies through these columns to California Cultivator, 115½ N. Broadway.

All communications to Dr. Whittlesey direct should contain a great big dollar.

Farcy.

I have a chesnut sorrel mare four years old which has the farcy on her belly. I feed no grain; nothing but barley hay. Can you tell me what to do for it?—A Subscriber.

I doubt very much if your mare has farcy but if you are positive that she has there is nothing to do but kill her, as farcy and glanders are one and the same disease, are incurable and dangerous in the highest degree to both animals and men. She may have a dropsical swelling due to a diseased heart, liver, or an impoverished condition of the blood. You do not state whether she is fat or thin, otherwise healthy, if she has been suckling a colt, whether she has been working hard or standing in the stable. Barley hay is mighty poor feed alone for any horse and on general principals should advise more grain and less hay.—R. T. W.

Shepherd Dog.

A valuable shepherd dog recently died. He was four months old. We thought it was a form of distemper. Last Thursday, two or three times during the day, he appeared stiff and sore in the hind quarters, otherwise same as usual, with good appetite. Friday evening gave him one cathartic pill which worked well; he also ate hearty supper. Saturday morning very weak and stiff. He died that night. There was no poison of any kind around. His principal diet when well was milk, scraps from the table; about three times a week gave him a little fresh meat. Please give me treatment and remedy. Want to be prepared if we should ever have another case.—A Subscriber.

The dog probably had inflammation of the kidneys and bladder, and possibly peritonitis at the last end. He may have had an obstruction in the urethra, as he urinated very little.

The treatment would depend on the symptoms as they were presented, and not empiricaly.

A post-mortem should have been made to determine the exact condition.—Dr. Whittlesy.

The record for Arizona oranges this year is held by a car shipped from near Phoenix. Some boxes sold at $7.20 and the total was $27.64.

The meeting of the Chelan County Horticultural Society of Washington was held at Wenatchee last week. Dry farming was the principal topic discussed.

At a recent meeting of the faculty of the Oregon Agricultural College the question of agricultural high and normal schools was discussed and recommended.

The Egyptian cotton which was grown in Arizona during the past season is pronounced by experts as showing more strength than the imported Egyptian fibre.

Farmers of Eastern Washington are discussing the question of the hired man, and the feeling that the white labor should be encouraged and Jap labor discouraged is increasing.

Landscape Architect Robinson's report on beautifying the city of San Jose will soon be delivered to the organization having the matter in charge and it is hoped the Garden City will become more beautiful under these plans.

FLYNN OF VIRGINIA.

Didn't know Flynn—
Flynn of Virginia—
  Long as he's been 'yar?
  Look'ee here, stranger.
Whar hev you been?

Here in this tunnel
He was my pardner,
That same Tom Flynn—
  Working together,
In wind and weather
Day out and in.

Didn't know Flynn!
  Well, that is queer.
Why, it's a sin,
To think of Tom Flynn—
  Tom, with his cheer;
  Tom, without fear—
Stranger, look 'yar!

Thar in the drift,
  Back to the wall,
He held the timbers
  Ready to fall;
Then in the darkness
  I heard him call:
"Run for your life, Jake!
  Run for your wife's sake!
Don't wait for me."
And that was all
  Heard in the din,
  Heard of Tom Flynn—
Flynn of Virginia.

That lets me out
  Here in the damp—
Out of the sun—
  That 'ar derned lamp
Makes my eyes run.
Well, there—I'm done.
But, sir, when you'll
Hear the next fool
  Asking for Flynn—
Flynn of Virginia—
  Just you chip in,
  Say you knew Flynn;
Say that you've been 'yar.
—Bret Harte.

GETTING HIS ANSWER.

THE young man had said what he had to say and had emerged from the ordeal feeling like a condemned murderer who had been reprieved.

The agony was over. He was even calm enough to note the frightful square jaw and protruding eyebrows of the elderly man on the other side of the library table instead of seeing pinwheels and stars as he had been doing ever since he had entered the room on his errand.

"Umph!" said the elderly man at last. "No, I'm not surprised. I'd have been a fool not to know it for the last six months! What else should I suppose you wanted—coming around here as often as you have and making a doormat of yourself for Margery and acting as if you liked being a doormat?"

"Oh, I suppose you love her and all that," went on the elderly man. "Seems to me, after a lifetime of observation, that it would not be a difficult task to fall in love with Margery. She's a pretty fine girl, when you come right down to it!"

"You're right there," agreed the young man, fervently.

"Others have thought so, too," remarked the elderly man. "Several others. But I told them no, right off the bat, because—well, you see, Margery had given me a gentle hint to turn them down."

He paused and brushed some cigar ash from his sleeve while the young man looked worried and most apparently had a question hanging on his lips concerning this point in its personal light to him.

"You don't know anything about being devoted to a girl!" thundered the elderly man, suddenly abandoning the cigar ash and transfixing the young man with his glare. "I suppose you think because every time you see Margery you have to travel six miles each way on a tolerably comfortable street car and, when the cars are blocked, get home at one or two o'clock in the morning and still must rise at six o'clock as usual, that you show great self-sacrifice and prove the depth of your infatuation! Humph!

"Let me tell you," went on the elderly man, "that in my day we did more than that and never deemed it worth thinking about! Why, after working like a horse from dawn till dark, when I was your age, real work with my hands, building houses—I didn't start right in cutting coupons, you know—when I was tired enough to go to sleep over my plate of baked beans, I'd oil my boots and rub down the horse and scrub up and hunt out my best tie and ride 15 miles to the next village where there was a girl with the blackest eyes you ever saw and take her to a dance. And after dancing till three o'clock I'd ride 15 miles back home, and maybe have time to pour a bucket of cold water over my head before I went to work again! Yes, sir! Not once, but many a time!"

"You—you must have been hard hit," ventured the young man, with a tentative smile.

"Well, I married her," snapped the elderly man. "And if you can beat her eyes today I'd like to see you do it! And we started housekeeping in a two-room cottage without all this new-fangled kitchen equipment. We had a frying pan and a kettle or two and a tin pan or so, and we didn't starve, either."

"I'd be willing to do the same with Margery," said the young man, sturdily.

"Humph!" said her father. "But Margery wouldn't. Things are different these days. Oh, you needn't tell me that you can give her about as good as she has at home—I know all about you and what your salary is! What do you think a father is for if not to keep an eye on the fellows who hang around his daughter? Not that I bother looking up very many of them!"

The young man strove to appear interested, but his natural impatience as to the outcome of his quest creased his brow.

"I'd be mighty good to her," he said, reflectively.

"Much you know about it," said the elderly man, almost angrily. "Life isn't all wedding cake and silk gowns and illuminations! It's a question whether when you are 60 years old and can look back over the troubles and sorrows and misunderstandings and just ordinary everyday vexations—they're the worst—you can say to yourself that you've always been 'mighty good to her!' It'll be a most uncommon and comfortable state of mind you'll be in, my boy, if you can!"

There was a solemn silence, while the elderly man frowned and smoked harder and the face of the younger man took on more thoughtful lines. Finally Margery's father got up and put both hands on the younger man's shoulders.

"I think," he said, quietly, "I think, my boy, you're the man! You see, I was told to say yes to you! And I like you on my own account!"

"Thank you!" said the young man a bit huskily as they shook hands.—Chicago Daily News.

Sarcasm is a mighty sharp knife an' th' fellow that's wise carries it closed.

OBSERVATION PARTY.

Would you like to know the way one hostess gave her guests a jolly evening? She called it an observation party. When the people arrived, each one was given a little blank memorandum book with pencil attached. Of course these can be made very pretty and elaborate, but plain white paper folded into little booklets and tied neatly answers every purpose. When all had arrived, the women sat in a large circle, every alternate seat being left vacant. Then the men were told they could have the privilege of talking five minutes to every women there, but they were not told why this favor was granted them. At the end of the series of five minute talks, the men were put in another room and then the mystery was unfolded. A list of questions was given each man and he was compelled to write answers to such perplexing queries as: What color are Miss A's eyes? Describe Mrs. B's dress. Does Miss C. wear a brooch? Does Miss D wear any rings? Did Mrs. E laugh while you were talking to her? And so on. The better the hostess knows her crowd, the easier it will be to compose amusing questions. Meanwhile the women in the other room are struggling with a similar list of questions regarding their late visitors, and while the women will probably have less trouble than the men, this is not sure by any means, and it will prove an eye opener to many women to learn how observant some men are. If you care to give a prize, let it be a small leather memorandum book or something equally appropriate. If your friends get as much fun out of this idea as one crowd did, we think the evening will be taken up with it so completely that you will not need to furnish any other amusement.

CAKES WITHOUT EGGS.

Eggs taste too much of money these days for the housewife to enjoy using them. These three recipes are economical ones to use and they are so good that no one will object to eating them, even if eggs are conspicuous by their absence.

Coffee Cake.

Two cups brown sugar, one cup butter, four cups flour, one and one-half cups hot coffee, half cup sour milk, two cups currants or seeded raisins, one rounding teaspoon of soda, two of allspice and three of cinnamon. Pour the hot coffee over the sugar and butter, add the fruit and sour milk. Sift the soda and spices with the flour. Bake in a moderate oven. This cake will be just as good if you use three-fourths of a cup of cottolene and a level teaspoon of salt instead of a cup of butter. A cup of English walnuts chopped fine may be added and an extra cup of currants.

Batter Cakes.

Soak about three slices of dry bread in a pint of sour milk overnight. In the morning add a level teaspoon each of salt and soda and enough corn meal and flour in equal quantities to make a moderately thin batter.

Ginger Cake.

Heat half pint of molasses until quite hot, then pour it over one-fourth pound of butter. Stir into this one well rounded teaspoon of soda dissolved in two tablespoons of cold water, then add half cup of boiling water. Sift a level tablespoon of ginger with enough flour to make a thin batter, about three cups, possibly a little more. Turn into shallow pans and bake in a moderate oven. Half a cup of cottolene and a level teaspoon of salt may be substituted for the fourth-pound of butter. This cake is very nice if baked in layers and jelly spread between the layers.

RECIPES.

Are you getting a little bit tired of fudge? Add some new touches to the chocolate or vanilla base. Chopped fruits, candied or dry, stoned dates, figs, cherries, pineapples, candied nuts, preserved ginger, peanut butter, anything, but only a little of each, chopped in bits and stirred in just after the fudge is taken from the stove will give it a new hold on your affections.

Two ounces of pulverized borax, four ounces of precipitated chalk, one ounce each of powdered myrrh and pulverized orris, sifted through bolting cloth, make an excellent tooth powder that is cheap, pure and efficient.

Pour a hot chocolate sauce over fresh little cup cakes and add a spoonful of whipped cream to each. This is an excellent way to make a very simple dessert answer the purpose of the elaborate one most housekeepers feel bound to offer company.

See how you like "collar," an English meat dish. Put through the meat chopper equal parts of cold cooked ham and tongue. Pound to a paste, add a little dry mustard, and heat the whole. Put in a bowl, add a weight, and let stand until cold. Slice thin and you will have a delightful meat.

Delicious Bread Sticks.

Bread sticks are delicious with any hot beverage, and are made this way: When you mold your bread into loaves, reserve a piece for your stick, work it as for loaf bread and then roll out to the thickness of a half-inch width, cut in strips one inch and a half wide and three inches long or longer. Let remain upon the board fifteen minutes, covered. In the meantime, have a frying-pan on the stove heating the lard to fry them in. Use plentifully of lard, but not so much as for crullers. Fry them a pretty brown, drain on a cloth; get all the grease off, then dust freely with cinnamon and sugar, split open while hot and butter and serve at once. If these are not to be eaten at once, omit the butter.—Philadelphia Inquirer.

DON'T REVEAL YOUR IGNORANCE.

We all want to be thought wise and the easiest way I know of to get such a reputation, whether one is really wise or not, is to stop talking. Just think about it. Isn't it remarkable how much of our ignorance we are not forced to reveal, but do reveal in merely aimless talk? And don't we all give a man credit for knowing many things because he at least knows how to keep still when he doesn't know about the thing under discussion? At the least, ability to keep still implies some self control and self control is a good quality on which to depend.

Sometimes we really have something to say. Then, condense. Talk to the point. Don't say unnecessary and irrelevant things. They only distract the attention of your hearer and weaken your argument. After a bucket is full to the brim the pump does more harm than good if it goes on working.

Cultivate the habit of reticence. So you will get a reputation for knowing more than you do and when you do talk you will be listened to. When in doubt, don't say it.

Eggs and Poultry.

The egg market has been very interesting for the past few days. The supply is exceedingly scarce and the storage supply is practically exhausted. On Monday a car of eggs was received from the Middle West by express. This was Los Angeles' first importation of a full car by express. The express charge was $700 and yet in the scarcity was justified. It is predicted prices will increase still more.

San Francisco Markets

SAN FRANCISCO, Jan. 12, 1909.

Butter.

Butter took a decided fall immediately after last quotations dropping to 33, the next day recovering to 34, later dropping to 33½ where it now stands. The market is featureless with much stock going begging.

The official quotations of the San Francisco Wholesale Dairy Produce Exchange for today are as follows:

California extras per lb 33½
California firsts 33
California seconds 27
Ladles extra 23
Storage Cal ex 30½

Cheese.

Hogs 130 to 250 .....6@6¼
Rough heavy .....4½@5
Calves per lb .....4@5
Lambs spring 5
Wethers No 1 .....4¼@4½
Ewes No 1 .....3¾@4

Potatoes.

A strong speculative inquiry is ruling in the potato market, which is entirely of a local character. Stocks in the country have turned out to be not as large as was thought and the drain on them for shipping purposes has caused a decidedly uneasy feeling in the local market, which has caused quotations to improve sharply.

Hay.

Somers & Co. say:

We are inclined to believe that prices will remain firm and possibly higher for some time to come as we are still having a heavy country demand and furthermore the possibility of bringing Hay from outside States seems more remote than ever for Hay in these States seems to have advanced just enough to prevent us from making shipments to California.

As is well known California is bebecoming a great consumer of Hay; many districts which formerly raised Hay extensively now raise but little and although in normal years they raise enough for their own use, yet this year owing to our short crop they are importing Feed. Several districts which were thought to have sufficient Hay for their own use are now beginning to inquire for Hay and state that they must soon make purchases.

All indications therefore are for a firm Hay situation, although a plentiful crop of grass will possibly change conditions considerably. As yet weather conditions have not been favorable for growing grass and therefore this element cannot be considered a definite factor.

Alfalfa is also higher, heavy demands being made on stocks by the dairymen who must feed until plenty of grass is available.

The present range of prices we quote as follows:

Choice wheat hay .....21.00@23.00
Good wheat hay .....19.00@20.50

Citrus Market

LOS ANGELES, Jan. 13, 1909.

The orange market is somewhat uncertain and rather unsatisfactory. The present rain may slow up shipments and aid in correcting the oversupply. In any case the shipments are not as heavy as earlier. Some low grade fruit has been shipped which meets cold weather in the East is one cause of the decline.

Lemons are rather easier. It was thought at first that importations would materially shrink owing to the Messina disaster, but it is now stated that it will have only slight effect. Present shipments are commanding fair prices.

Shipments.

Shipments of oranges since Nov. 1, 1908 aggregate 2,486 cars of oranges and 758 lemons.

NEW YORK, Jan. 8.—Two cars navels sold. The market is very firm. Weather clear and cold. Another cold wave predicted—also snow.

THE PLACE OF THE TELEPHONE IN MODERN FARMING.

The wheels of the business world are revolving faster every day. Human ingenuity is constantly seeking new devices to save that most valuable asset of modern business—time. One after another, new inventions are being brought into use in an attempt to increase the speed of these wheels to the utmost.

Of all such time saving inventions the greatest is undoubtedly the telephone. Introduced only about thirty years ago it is under present condi-

tions an absolute necessity as a means of communication. This necessity has spread from the large city to the small city, from the small city to the town, and is now making itself felt in the rural districts. The modern farmer does not regard his telephone as a luxury but recognizes its value as a financial asset. He realizes the necessity of keeping in close touch with trade conditions. With the aid of the telephone he can buy his supplies when the market is low and sell his crops when it is high.

That farmers all over the country are having their farms connected by telephone is the best possible proof of its value and that it has come to stay. The farmer, as a class, is the hardest person in the world to be persuaded to adopt an uncertain proposition in spite of the proverbial "gold brick" stories which are credited to him. His decisions are the result of careful thought and due deliberations. But once convinced he is not slow to action.

In selecting equipment for a telephone system it is well to keep the following in mind. The telephone is a very delicate organization and must be perfectly made in order to give good service. Buy a cheap make and the cost of maintenance will be high. Continued repairs will be in order and the service will be poor. Therefore, nothing but the best is the cheapest in purchasing a telephone equipment.

Western Electric telephones have become so widely known and have given such splendid service that they are considered standard in the telephone field. It will pay you to read the Western Electric Company's advertisement on another page of this issue.

A raisin grower of Hanford has suggested that the entire raisin crop be screened at the packing houses and all small raisins be disposed of in California for hog feed if necessary and only the larger and better stock shipped to eastern markets. He maintains that the extra price received for the better goods would compensate for the loss of the poor stock.

A resident of Lindsay reported that while in Montreal he saw California oranges selling at nearly three times the price of Floridas.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

A TURKEY FARMER'S SECRET.

A turkey farmer pointed to a small mill, wherein a small petroleum engine chugged, chugged, vigorously.

"In that mill," he said, "the feed for my 2000 turkeys is ground. The secret of success in turkey raising lies in abundant feeding. It keeps six men busy to feed my birds.

"They are fed five times a day, and each turkey gets as much as he can hold. Carrots boiled in lard and crushed barley and milk are very good fatteners, and the birds stuff themselves with them. Then, the last thing before going to roost, they are allowed to eat all the oatmeal porridge and buttermilk they can find room for.

"Cocks cost more than hens on the market because they are harder to raise. If they get together they fight and kill one another and they eat five times as much as a hen.

"A cock three hours before killing is made to swallow a half pint of vinegar. This vinegar makes his flesh fine and tender; without it he would be coarse and tough.

"A turkey farm like mine pays easily from $1500 to $2000 a year."—Farm Magazine.

Apropos of Prof. Hilgard's Articles on Pure Gypsum or Land Plaster

The Berkeley Agricultural Experiment Station Soil Expert, Prof. Loughridge, says of my Gypsum:
"A very pure sample, much above that ordinarily obtained in the market. There is only a trace of carbonate of lime present."

Of another grade submitted to him, Prof. Loughridge said:
"It contains so large an amount of carbonate of lime that on land heavily manured it might do injury by setting the ammonia free."

A pure gypsum conserves the surface moisture of land.
Gypsum sweetens the earth. Plant-life cannot thrive under acid conditions, no matter how much fertilizer is used.

Oak Ashes Slacked Lime

In Straight or Mixed Carloads or Less

Slacked Lime takes the place of Gypsum on land not heavily fertilized. Hardwood Ashes contain lime, phosphoric acid and potash.

Common Sense Fertilizing

I guarantee my commercial fertilizers to work satisfactorily, or money back, if experts' directions are followed. The only fertilizers so guaranteed.

A dozen different kinds for all varieties of fruits, berries, vegetables, nuts, flowers, alfalfa. They increase quality as well as quantity of product. High-grade, reliable, scientifically compounded.

The successful grower fertilizes because it pays; not because he has to.
I also sell sheep, pigeon, dairy and stable manures.

The Effect of Various Limes on Soils

An Article Written for Cultivator Readers

By PROF. E. W. HILGARD of the State University

IN response to your request for information regarding the effects of lime on soils, and the differences to be expected between the use of sugar factory lime and other lime products, I can briefly summarize the matter as follows:

There are very few soils in California that require the addition of lime; the average content being over ten times greater in California soils than in Eastern ones, which are improved so much by liming. The improvement in soil conditions caused by liming are partly mechanical, by facilitating tillage and penetration of air and water, and partly chemical, in that it neutralizes any acid soil conditions and promotes the growth of bacteria in general, and those of the legumes in particular; whence the very abundant natural growth of legumes in California. It may be said that in valley soils lime will usually in California produce very little effect, except that heavy clay or black adobe may become more tillable.

This general statement holds true of all the various lime fertilizers, including marl but not gypsum. Quicklime acts most quickly on the soil, but is apt to produce a waste of humus unless accompanied by a green manure crop. It is not desirable to use it on light soils at all.

Air-slaked lime is very much milder in its action than quicklime; only half of it being in the form of effective lime, the rest being in the same form as marl; that is, carbonate or limestone. It acts more slowly than quicklime, and is less apt to be overdone.

As for sugar factory lime, it is altogether in a carbonate form; that is, it is the same as finely ground limestone or marl, but it contains in addition some of the ingredients of the beet—to wit: about two per cent or a little more of phosphoric acid, and perhaps half of one per cent of nitrogen when it is fresh. When old, a large proportion of the nitrogen has disappeared into the air; though some of it remains in the form of nitrate of lime. The total value of these ingredients on the usual commercial basis is from $2.25 to $2.50 a ton; the very fine state of division of the lime in this material renders it quite effective where lime is needed in the soil.

As to hydrated lime; it is merely lime "dry-slaked"; that is, with only about half its weight of water, of which one-half will evaporate in the slaking, so that the dry-slaked lime consists to the extent of one-fourth, of water. As it is perfectly easy for any one to dry-slake lime at home, it hardly seems necessary to pay for having it done outside and pay transportation on one-fourth its weight of water. The effect, however, is the same as that of quicklime.

Now as to gypsum; in California it has some additional usefulness to that which it possesses elsewhere; namely: the neutralization of black alkali wherever that happens to be present. It has no effect whatever upon white alkali. It has a special action in favoring the growth of legumes, such as alfalfa, beans and vetches, because of its being particularly favorable to the growth of bacteria; being, in fact, recognized as the most active substance in that respect. Moreover, it acts in setting free, or making available, potash from silicates of the soil. For a time, therefore, a dressing of gypsum may take the place of a dressing of potash, but of course its effect in that direction will soon be exhausted. Gypsum is a very undesirable addition to our sour soils, as it increases their sourness and should never be used on swamp lands.

This is about as much as can briefly be said in answer to the queries proposed by your correspondents. If they should desire to go more into details, it may be well to look up what is said on the subject of the effects of lime in my book on "Soils," 379-380.—E. W. Hilgard.

* * *

The book "Soils" written by Prof. Hilgard is one of the most complete and exhaustive works of its kind, and should be on the shelf of every farmer and orchardist in California. It is a large book of nearly 600 pages and almost every phase of soil condition, mechanical or chemical is explained.

The paragraphs referred to by the Professor summarize the effects of lime carbonate on soils, its advantages and possible disadvantages as follows:

"Physically, even a small amount of lime carbonate, by its solubility in the carbonated soil-water, will act most beneficially in causing the flocculation of clay and in the subsequent conservation of the flocculent or tilth condition, by acting as a light cement holding the soil-crumbs together when the capillary water has evaporated; thus favoring the penetration of both water and air, and of the roots themselves. It should be added that according to the experience of the writer, amounts of lime carbonate in excess of 2 per cent do not add to the favorable effects except as would so much sand.

"As to chemical effects, among the most important are:

1. The maintenance of the neutrality of the soil, by the neutralization of acids formed by the decay of organic matter, or otherwise.

2. The maintenance, in connection with the proper degrees of moisture and warmth, of the conditions of abundant bacterial life; more especially those of nitrification, thus supplying the readily assimilable form of nitrogen. Also in favoring the development and activity of the root bacteria of legumes, and of the other nitrogen gathering bacteria.

3. The rendering available, directly or indirectly, of relatively small percentages of plant-food, notably phosphoric acid and potash.

4. The prompt conversion of vegetable matter into black, neutral humus, and (as shown in the case of the soils of the arid region) the concentration of nitrogen in the same while accelerating the oxidation of the carbon and hydrogen.

5. It counteracts the deleterious influence of an excess of magnesia in the soil.

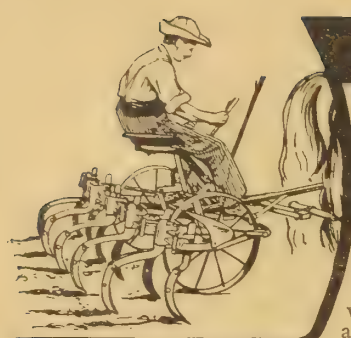
6. In alkali soils, it counteracts the injurious action of the soluble salts upon the growth of plants, not only in the form of carbonate, but also in those of sulphate and chloride.

7. As a matter of experience, both in the case of grapes and orchard as well as wild fruits, an adequate but not excessive supply of lime in the soil will produce sweeter fruit than when lime is in small supply.

8. An excess of carbonate of lime in soils (from eight to twenty per cent and more), constituting "marliness," tends to seriously disturb the nutrition and general functions of many plants (calcifuge), and to produce a suppression or diminution of the formation of chlorophyll and starch; as in the case of grape vines, citrus fruits and others, which neverless flourish best in lands moderately calcareous.

"Among the points thus enumerated, the third and fourth require some comment. Without pretending to define exactly how lime acts in rendering other ingredients more available to plant assimilation, attention may be called to the fact that lime carbonate may be considered as acting similarly to, albeit more mildly than, caustic lime, in the displacement of other bases from their compounds. It doubtless acts thus in liberating potash from its zeolithic compounds. As to phosphoric acid, the connection of the effect of lime carbonate with the remarkable availability of that substance when present in the form of tetra-basic salt, in the case of phosphate slag, is at least possible.

California Combined Harvester at Work in San Joaquin County.



Planet Jr.

The Planet Jr. Orchard and Universal Cultivator does more work and does it better than any other implement for the same purpose. Carries attachments which thoroughly cultivate, furrow and hoe at any required depth in orchard, vineyard, or hop-yard. Equipped with side-hitch and fruit-tree shield. Can be made into a disc cultivator. Made by a practical farmer and manufacturer, and especially adapted for your work. Thousands of Planet Jr. Cultivators are in successful use in California and other fruit-growing districts.

We carry stock in San Francisco. Agencies in all principal Pacific Coast cities. Write for name of nearest agent.

Write today for our new 1909 catalogue of 45 kinds of Planet Jr. implements for every farm and garden use.

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

With the Citrus Growers

THE VALUE OF HUMUS.

The effects of humus on soils are both physical and chemical. Its physical effects are due in part to its remarkably porous structure which not only lightens the texture of soils, but also increases the absorptive power of soils for water and the plant food dissolved in it. Compounds formed between humus and lime, iron and some other elements have strong cementing properties and hence improve the crumb structure of soils, rendering them more friable. The chemical effects on the soil are in part those due to the slow decay of the humus and the liberation of the nitrogen, phosphorus and potassium of the original vegetable matter from which it came.

The nitrogen is especially important, and Hilgard says: "Soil humus is doubtless the chief depository of soil nitrogen and the main source from which, through process of nitrification, the nitrogen supply to plants is usually derived."

The total nitrogen in the soils of the college farm was nearly proportional to the humus and averaged one part of nitrogen to 14.8 parts humus in the clay loam and 1 to 12.8 in the clay.

There is also considerable evidence that humus can unite with some of the compounds used in fertilizing our soils. It has been shown that ammonia salts will combine with humus, the ammonia of the salts replacing lime in the humates.

Similar results have been obtained in this laboratory when potash salts were used instead of ammonia salts. The potash disappeared from solution when humus was added and lime was found instead, showing that the potash must have combined.

It is stated also that humus absorbs monocalcium phosphate, or what is commonly called superphosphate of lime.

It was also noted in our work that nitrates did not seem to leach away in the presence of humus. On three plots used for a top dressing experiment, fertilizers had been applied as follows:

a. 300 pounds per acre of complete chemical fertilizer, including nitrate of soda.

b. No manure or fertilizer,

c. 300 lbs. per acre of nitrate of soda.

The humus and total nitrogen percentages were:

a.	Humus	2.56	Nitrogen	0.18
b.	Humus	2.57	Nitrogen	0.16
c.	Humus	2.51	Nitrogen	0.20

Experiments are needed to determine whether humus can combine with nitrates as well as with ammonia salts. However, it is more likely to be the fact that by reduction, nitrates are changed to ammonia and held by the humus, as in the addition of ammonia salts.

The compounds of humus with the soluble superphosphate of lime, ammonia and potash must undergo decompositions similar to those by which the original fertility elements of the humus are made available in the soil. Thus, in the presence of humus not only are there plant elements from decaying vegetable matter, but also added fertility elements may be held in a similar condition of availability.

Without the humus, phosphates and potash salts must at length change to the insoluble compounds of those elements naturally present in the soil minerals, while nitrates are leached from the soil by the drainage water.

When these different effects of humus are considered, it can be readily seen how important it is to soils and why sandy loams are regarded as poor soils.

There is a difference of .75 per cent between the sandy loam and the clay loam in the humus, which, calculated on a basis of 3,000,000 pounds of soil per acre-foot, in eight inches would mean 15,000 lbs. of humus or 7.5 tons, requiring over 28 tons of stable manure to make it good. The manure is calculated on the basis of its containing 26 per cent of organic matter, not all of which would be humus and consequently a pound of organic matter in manure would not be equivalent to a pound of humus in the soil.

Such a difference in humus means also a difference in the moisture, nitrogen, phosphoric acid and potash associated with it, which, as has been shown, are in the most surely available forms for plants to use.

Since sandy soils are especially favorable to the destruction of humus, these available forms of plant food change to less soluble forms, or leach away, as the humus decomposes, unless taken up by the crop then on the land. Large dressings of manure, therefore, have not the lasting effect that is noted on heavier soils and the same is true of chemical fertilizers. Frequent rotations of crops are especially beneficial on these soils, since there are thus added many hundred pounds per acre of vegetable matter in the form of roots and stubble, by the decay of which humus is formed and the texture of the soil and also the chemical composition improved.—N. H. Bulletin.

SAVE THE WATER.

At a recent institute at Beaumont, J. B. Neff gave some excellent advice on conservation of water in orchard and vineyard, from which we quote:

The great question is to save the water where it will do good. By the present lack of proper irrigation at least half the available supply goes to waste.

Flowing water as measured by miners' inches, fifty miners' inches will cover one acre one inch deep in one hour if there is no waste, but variation of soil, temperature and manner of applying the water cause the waste to vary. Different vegetation requires different amounts, but as a rule it takes 100 or 200 pounds of water to produce 1 pound of dry material, and the amount equivalent to this proportion would be for hay 3 to 5 inches in depth of water during the season, while wheat must have only two to two and one-half inches. Corn needs 20, alfalfa 30 to 50 oranges 30, walnuts 25; these estimates meaning in addition to the natural rainfall.

Meadow grass contains seventy-one hundredths water lettuce 95 to 99.

Before planting an orchard especially make sure of water at any time it is needed.

After each rain loosen the soil to keep the water inside. One inch of water will saturate three inches depth of earth.

Some sandy soils will not receive more than 15 per cent. of their weight, adobe and the like will hold 30 per cent, while soil which is largely vegetable mould will receive much and yet give up to plant growth all but three per cent. Thoroughly dry sand requires six inches of water to saturate it, but an orchard must have water available or the crop is doubtful. In land that retains a good supply you might save the crop without irrigation, but grain is much more likely to prosper. Plow deep, cultivate by pulverizing till no crust is left, keep down the weeds, and 10 to 15 inches should make grain do well, and on retentive soil one inch constant flow to 10 acres will usually insure ordinary crops.

Transpiration is water passing through the plant and out at the leaves; evaporation is moisture escaping from earth into the atmosphere. Either is less in cold than heat.

Leaf mold or granular mulch four inches deep keeps moisture below if kept dry on top, so it will not draw the water to the surface. In wet soil evaporation will lose four inches per week, while soil dry on top will only release from one-fourth inch to an inch in the same time. High temperature and little cultivation will sometimes cause a loss of nine-tenths of the water in storage in the soil, in a single week.

When soil is 90 degrees in the shade it will go 95 to 100 in the sun. Loose soil will be 10 degrees cooler 1½ inches below the surface than tight, and will save 20 per cent. of

A little building paper or laths placed loosely around tree trunks will help to prevent sun scald.

water, while temperature kept down to 57 degrees will save much more still.

Try to avoid the water going too deep. A furrow six inches deep is about the fair average to be desired on various soils, harrow or cultivate to loosen and dry out top soil, covering the furrows quickly if the soil is not of a nature to draw up the moisture.

Water inclines to sink directly downward rather than sidewise, so irrigating ditches should not be more than three feet apart. Potatoes can find and keep the water near their roots at that distance if the furrows are not so deep the water gets too far below to start with.

Have an even slope if possible, nearly level preferred, or govern the course of the water by the arrangement of your ditches.

In tree planting put a furrow three feet each side your row of trees and dig about each tree a circle six feet in diameter the first year. After one year's growth eight or ten feet will do. Take care of spaces between trees, leaving no weeds to take the strength and moisture from the ground.

Late fruits need about one inch more water than early ones, but none except apricots after harvesting of fruit. Set apricots 24 feet apart and most or all other trees the same for best results. Furrow deep to coax tree roots down and never water trees nearer ripening time than two or three weeks, and figs from four to six weeks. After the first crop of figs is off a good irrigating will develop the second fruiting. Never irrigate grapes after July.

REGARDING THE DATE.

Observations on the date are chronicled in an article in the Plant World of recent issue. Regarding the date fruit and its ripening it says:

"The development of the fruit takes place in three stages. After fertilization very little change in the fruit itself can be observed for several weeks, but during this period the entire energy seems to be expended in building a long massive stem. When this is nearly completed, the fruit starts to grow and the seed to mature. When the fruit has reached its full size, but is still green, it corresponds very closely in chemical character to any other nonstarchy fruit, and contains about 20 per cent of dry matter. The third stage now begins and additional sugar is heaped into the fruit at a rapid rate without any apparent change in size until upwards of 60 per cent dry matter is present. It then softens, the tannin becomes insoluble with consequent loss of astringency, and the fruit is ripe."

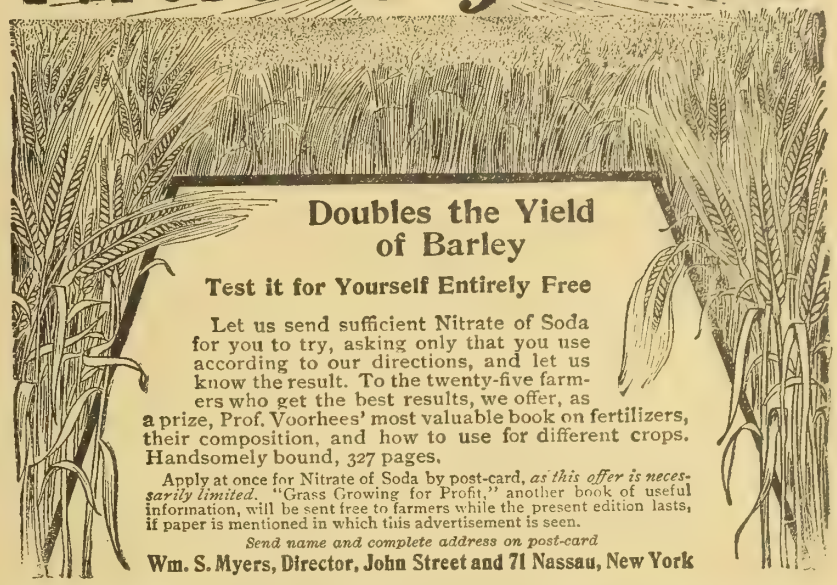
CONCRETE HUMMOCKS FOR AUTOMOBILISTS.

Concrete hummocks a foot high, and located about 150 feet on either side of grade crossings, is the latest device to be used to prevent crazed automobilists on Long Island from endangering lives by recklessly driving over grade crossings, regardless of approaching trains. This scheme was decided upon at a conference in Long Island City between a number of prominent men who are desirous of putting a stop to speed madness.

Without previous discussion, says Cement Age, New York, the investigation has completely influenced them in favor of the hummock plan. It is in successful use in Babylon and is said to have been the only device thus far evolved which has put any sort of check upon speeding automobilists. When one of these "thank you ma'ams" looms up in the distance the driver of the machine must either slow down or risk smashing the springs on his machine, if not a more serious breakdown. The slowing down at these hummocks sufficiently far away from the tracks would have the double effect of curbing the speed mania at that point and give the occupants of the automobile a chance to find out if the distant railroad crossing was safe.

Break the crust of soil beaten hard by the storms. Go over the garden after a hard rain, loosening the soil, and the hose will not be so much in demand.

Nitrate of Soda



Doubles the Yield of Barley

Test it for Yourself Entirely Free

Let us send sufficient Nitrate of Soda for you to try, asking only that you use according to our directions, and let us know the result. To the twenty-five farmers who get the best results, we offer, as a prize, Prof. Voorhees' most valuable book on fertilizers, their composition, and how to use for different crops. Handsomely bound, 327 pages.

Apply at once for Nitrate of Soda by post-card, *as this offer is necessarily limited.* "Grass Growing for Profit," another book of useful information, will be sent free to farmers while the present edition lasts, if paper is mentioned in which this advertisement is seen.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

GRAPE GROWERS ALERT.

THE following communication shows the situation now confronting the table grape growers of this state. That the growers are awake to the situation is shown by the resolutions passed by the grape growers at Lodi. The communication is as follows:

At the session of the State Fruit Growers' convention at Sacramento, in the subject of "Marketing of Table Grapes" the information was brought out that an effort was being made by the New York commission houses to secure through a ruling of the Treasury Department, a rearrangement of the measurement of the barrels containing imported Spanish grapes, thus practically reducing the duty 53 per cent.

"Instructed by the convention, Chairman Jeffrey appointed a committee of three to oppose the move. This committee has been active and has discovered that the matter is more serious that at first supposed. A petition has been filed with the Ways and Means Committee, headed by Sgobel & Day per H. W. Day, asking that the duty on Almeria grapes be entirely removed. This petition is full of misrepresentations in regard to the grape industry here.

Two thousand car loads of these imported grapes enter the New York market and have made their way this season west, to Portland, Oregon.

To remove the tariff on them would, no doubt, be very injurious to the California grape industry.

It is highly desirable to bring to the notice of the fruit growers of the entire Pacific Coast, that the New York men that have been receiving a large share of the business of California, Oregon and Washington, and who have written hundreds of letters to grape growers, mentioning the market depressions caused by the arrival of Almeria grapes, are now busy endeavoring to persuade the Ways and Means Committee that Almeria grapes do not compete with California grapes, and endeavoring to secure tariff legislation ruinous to their Western customers.

This committee will continue to do its utmost to prevent such legislation, and would be glad to receive the co-operation of the organized fruit interests of the State, as well as commercial bodies.—Robert G. Williams, Chairman, Almeria grape tariff committee, 35th State Fruit Growers' Convention of California.

The petition of Sgobel & Day and others is too long to give in full, but from it we take the following extracts:

"The fruit is no longer a luxury and should be within reach of all citizens, but as this country is unable yet to meet this demand, unless foreign grapes are brought in, the consumer will either be unable to enjoy the fruit, or, on account of the shortage, the price will place it beyond the reach of masses. The question of revenue, never having amounted to $300,000, is too small to be of moment in comparison with the rights and interests of the public and consumer, who would be permitted the use of this healthful fruit at the minimum cost. The duty is not required as a protection to the home product and is only called for by the home producer in order that he may reap the benefit of the higher prices thus established.

"The present consumption of grapes grown in California and Spain in the American market is about 55,000 tons, of which quantity during the present season California supplied 41,000 tons. This is no longer an infant industry requiring protection, as the home product is nearly three times as great as the quantity imported.

Almeria grapes do not compete with California or home-grown grapes, as the time of marketing and the quality of the grapes are separate and distinct.

California grapes market from September 1st until about November 15th. Almeria grapes market from October 1st until about December 15th although the larger part of them are held by jobbers in cold storage and sold to the retailer and consumer from January 1st until April 1st.

The California grape must be eaten within seventy-two hours after leaving the refrigerating car. It is not a fruit that will store to keep.

These conditions separate the fruits so that it cannot be claimed in justice that the imported grape has any effect upon the price of the home product.

If the Almeria grape fails to be imported however the price of the California grape would as a natural consequence advance, since California is not yet producing a large enough quantity to supply the demand. Under the present duty rate the Almeria grape cannot be successfully imported."

Later the petition gives extended comment to the demoralized condition of the vineyard growers of Spain. "Owing to increased price of labor the cost production has risen until they are seriously considering retiring from the business. This they will do unless the tariff is removed and they are permitted to enter this country. This means that the imported grape trade will cease."

The American grape grower surely has abundance of sympathy with the grape grower of Spain and wishes for him success in his work of growing grapes. But for the American to consent to slaughtering his own industry which now feeds his family for the sake of the Spaniard is going far beyond any action which we believe the importers of New York City would ever take for themselves. It is unthinkable that the Ways and Means Committee will be influenced by the appeal of Sgobel and Day and others.

The following resolution was passed by the Lodi Growers:

Resolved, by the table grape growers of San Joaquin county, in meeting assembled, That we hereby petition Congress to take no action on the petition headed by Sgobel & Day and submitted by Frances E. Hamilton, to the Committee on Ways and Means, as shown by Print No. 42, until we can present facts and figures showing its inaccuracies and misstatements.

Resolved, That we do further petition that, instead of either reducing or removing the duty on the Almeria grapes, the duty be increased until the duty added to the freight will at least equal per pound what it costs us per pound by rail to New York, thus giving the grapes raised in this country at least an even chance with the foreign-grown grapes.

A COMMITTEE NAMED.

Judge C. W. Norton, Robert K. Williams, H. H. Fanning, J. McKindley, George Lawrence and George W. Ashley were appointed to present the cause of the growers to Congress.

INSECTICIDE LAW.

The following is the gist of the Colorado law on sale of insecticides in that State:

"It shall be deemed a violation of this act for any one to sell in Colorado insecticide poisons such as Paris green, London purple, white arsenic, arsenate of lead, arsenate of soda, arsenite of lead, arsenite of soda, acetate of lead, cyanide of potassium, hellebore, pyrethrum powder, and the like, that are diluted or mixed with other substances, unless the kind and amount of the adulterants or mixtures are conspicuously printed in plain English upon each and every package sold. Upon each and every package of white arsenic, arsenate of soda, arsenite of soda, acetate of lead, and cyanide of potassium, sold in this State, the percentage of guaranteed purity must be plainly marked, and on all packages of arsenate or arsenite of lead the amount of water must be guaranteed."

A. E. SCHEIDECKER **SEBASTOPOL, CAL**
Prop. Pleasant View Nursery.

Arizona produced over $6,000,000 in general farm crops last year.

Observations of a Tenderfoot

Miss Bee Josephine O'Mealey of Kanova Ranch at Anderson, Shasta county, gives these instructive observations of a Tenderfoot. She will surely cease to be worthy the name "tenderfoot" if she continues to observe and study California conditions as closely as she has up to this time. We hope we may hear from her again.

EVERY year hundreds and thousands of people pour into this great state, and buy homes and engage in fruit raising. Many of them have never owned a fruit tree before, these are better off than the experienced eastern horticulturist, for they have nothing to unlearn.

Our own introduction is so recent that we have not forgotten the many things which were such mysteries to us, and we may be able to aid the beginner in some of the matters, which, to the experienced grower, are so simple as to be a matter of course.

Our friends and neighbors said: "In pruning you must cut back the ends of the new growth so as to learn what buds the tree can comfortably carry, and thin out the branches where they cross or are too thick," That sounded easy, so three of us went into a five-year-old peach orchard, and in one short December day pruned 84 trees, and had an apron full of clippings on the ground.

We did not understand the meaning of "too thick." Fortunately, for us, an expert orchardist came along and explained to us what pruning really is. I am loath to admit that we were more stupid than the average beginner, we had simply never thought or understood, that reproduction of species is the primal instinct and object of all life, animate and inanimate. According to nature's plans—which are the antithesis of ours—the peach seed or pit is the object of importance, and the greater the number of seed or offspring a tree may produce, the sooner is its work done, its vitality exhausted, and it is ready to yield its place in life to the young of its own creation.

Man, however, desires the fleshy covering of the seed—not the seed itself—and would be very glad to dispense entirely with the seed. Man also desires to prolong the life and usefulness of the tree as much as possible, therefore it follows, that he must pursue a course which will compel the tree to produce a greater amount of the flesh; and a lesser number of seed since it is the seed which saps the strength and endurance of the parent.

We understand that a tree has a certain amount of sap and energy, which for our own best interests must be conserved and forced into the channels adapted to our needs and desires.

A tree left to itself will throw out a great many branches, which must of necessity be weaker than a lesser number would be, and set numbers of fruits which are, of course, smaller than if they were limited.

You remember our arithmetics taught us that "the greater the denominator, the lesser becomes the fractional part of an integer." Just so, the greater the number of fruits the smaller, must each become. Therefore it follows that the growth of a tree must be restricted, that the sap and energy may be concentrated on this task of making fewer limbs but better ones, to hold up fewer fruits but better ones. In order to do this we cannot cut off one-half or two-thirds of the tree in an entirety, and let the rest stand undisturbed, for thus, there would be no balance or symmetry, the over-crowded fruits would be misshaped and the overburdened branches would break down, on the contrary the cutting must be here a little and there a little, keeping in mind the fact that sunshine and free circulation of air are essential to perfect development, therefore the limbs must be cut away so that each one left may be free from contact with, or shadow from its fellows; they must be shortened back that the weight may not come too far away from the center, nor must the tops be allowed to grow too high, for that makes the fruit difficult to harvest.

The branches must not be cut too high from the ground, lest the trunk sunburn, nor too low and spreading, because then they would be broken by cultivation. The tendency of the branches is to reach outward toward the light while the weight of the fruit drags a down-hanging limb yet further down, and if too much strain is permitted the result is a broken branch, wasted fruit and an injured tree. And also the position of the fruit buds must be taken into consideration. If you are very new, you may not know, we did not, that the fruit buds are those grayish woolly knobs on the young new wood, each one growing out of the scar left when last year's leaves fell. Those little brown protuberances will produce twigs, or part of them at least. The foliage is so distributed that its weight is inconsiderable and we must prune so that the weight of the fruit may not draw the tree out of shape.

Look at a twig, count the number of fruit buds, assume that one-third of them will develop, picture to yourself the size and weight of the peach at maturity, then estimate how many of these buds should be left on a twig. There is no hard and fast rule, a great deal must be left to one's judgment, and in the words of the old darkey cook: "If you got no judgment, may the Lord have marcy on yuh."

It is hard indeed to cut off great branches full of those little fuzzy buds of promise but much harder, for the novice, to spend weary days a few months later, thinning.

In my childhood my grandmother slapped my fingers many times for picking the little hard green peaches but need compels me to disregard those early lessons, and so, after careful pruning, peaches must be thinned and the more the better, a peach to each six or eight inches of twig being about right, if on opposite sides of the twig, they may be slightly closer. I do not for a moment think you will follow this rigidly, we do not ourselves though we know we ought, but it does seem such a waste.

An experienced orchardist told us—"No man can thin his own trees, he should hire some one who is mad at him to do it."

But again judgment must come into play, a full grown tree should produce three hundred pounds of peaches very comfortably, and you must choose whether that three hundred pounds shall number 600 or 700 or 2000. Remember it is the seed that saps the strength of the tree, call to mind the salability of small fruit as compared with large—if you contemplate drying your peaches figure how much longer it takes to cut and place six peaches than one and decide on the course which will prove most profitable, for after all it is the elusive dollar for which we are all hustling, and the health and beauty and poetry of horticulture is in most cases only a side issue.—Bee Josephine O'Mealey, Kanova Ranch, Anderson.

BETTER NUTS.

In a communication in the Tribune of Fullerton, Mr. A. A. Mills of Anaheim touches upon the problem of producing more No. 1 and less of No. 2 walnuts. On this point he says:

To correct these light weight nuts in the future is the problem. Probably all of our walnut lands have been cropped or double and treble cropped for upwards of fifty years. In many cases these lands have never received any fertilization, rarely fertilization in limited amounts, and probably never in sufficient quantity to supply the actual needs of the trees. Then again the physical condition of the soil has not always been kept at the best and generally irrigation during the summer months has been inadequate and often omitted altogether. Sooner or later such methods are bound to bring disaster.

To correct this for next season's crop, begin this week; sow the walnut orchards down to Canadian or to Prussian Bluefield peas, as it is now too late to sow other green manure crops. Keep the orchards well irrigated if rain should be scant, so that by late spring there shall be an abundant growth of the peas. If possible, have the peas innoculated with the nitrifying bacteria which might be obtained from the Department of Agriculture, Washington, D. C., on a hurry call. Allow the peas to stand until the vines are mature and the first peas begin to ripen. Then work the whole mass into the ground with a disc harrow, as it will be impossible to plow them under. After this is well rotted apply some good complete commercial fertilizer, say about 500 pounds to the acre, this fertilizer to contain blood meal and acidulated bone. Under no conditions use bone that has not been acidulated. During the summer irrigate well enough to keep the trees in a fine growing condition until the nuts begin to ripen, which will be from September 1st to 15th. The increase in quantity and quality would probably pay ten fold.

The Rex Company are advertising the highly recommended Rex Lime and sulphur solution manufactured at Benicia in this paper. From many who used it last year, with scarcely an exception come flattering testimonials. As an insecticide and fungicide it is giving good results. Address the Rex Spray Co., Benicia, Cal.

California Farm Names

This interesting bunch of farm names has been crowded out too long. It is one of the most interesting features of the Cultivator and gives beside an insight into methods of work in many parts of the state.

Send in your ranch name. If it's only an acre in size give it a name, you'll love it more, you will keep it up better, give it a bigger lawn and more flowers.

Name the ranch.

"Carson Heights," owner, Mr. & Mrs. Fred E. Judson, San Pasqual, San Diego county. This ranch is a part of the old home ranch of Mr. John Judson, one of the pioneers of '49. Regarding their home and its historical surroundings, the Judsons write:

"It is situated in the San Pasqual valley on the mountain slope just below where ran the old Fort Yuma trail used by the soldiers during the Mexican War. In this valley the famous scout, Kit Carson, and the American soldiers under General Phil Kearney fought a battle with a force of Mexicans. The Americans lost about 18 men and had as many more wounded. The Mexicans surrounded the Americans after the battle and Kit Carson and Lieutenant Beale slipped through the Mexican pickets during the night and made their way over the trail to San Diego bringing back re-enforcements. Carson Heights is devoted to raising thoroughbred White Wyandottes, English walnuts, alfalfa and dairying. Bananas have been successfully raised on the higher portion of the ranch. The water used for home and garden purposes is brought from mountain springs several hundred feet above the ranch, giving a pressure of 200 pounds per square inch. The power produced is used for running machinery."

"Mountain View Ranch," owner, Roy E. Swigart, Macdoel, Siskiyou county. Mr. Swigart uses well printed stationary, both letter head and envelope. Mountain View Ranch is located in Butte valley in Siskiyou county and has the finest of sunshine and most beautiful weather. It is however surrounded so completely by mountains that the name Mountain View has been chosen for the ranch. The mountains surrounding are covered with pine and the valley with juniper and sage. "Old Mount Shasta, ever white robed, is at the south end of the valley and Mount Pitt shows boldly above the rest of the range on the north."

"Dos Alisos," owner, G. S. Storrs, Duarte, Los Angeles county. This home is in the midst of a beautiful setting of orange groves in the foothills above Duarte overlooking the beautiful San Gabriel valley and but a few miles out of Los Angeles.

"Steladelma," owner, G. W. Scott, Madison, Yolo county. Mr. Scott writes that he considers the farm names a valuable feature of the Cultivator and in explanation of the name "Steladelma" says that it comes from the names of three daughters, Stella, Addie and Elma. "We devote the land of this place to diversified farming and stock raising which I think are inseparable if profit is desired. We have all kinds of stock and a fine flock of White Leghorns. Besides the horses used in farming operations we have a 32 horse power traction engine used largely in the grain fields. I am now 80 years old, in good health, full of hope and vigor and in expectation of a bright future here in this world."

"Acacia Farm," owner, Mrs. B. Marks, Dos Palos, Merced county. Mrs. Marks writes she has been a subscriber to the Cultivator for over ten years and expects to be among the subscribers for the next 40 years "as I am now only 60 years and doing the greater part of the work on our little 20 acre farm. Your suggestion that we name our farm is fully appreciated. Thank you for the interest you have taken for our welfare. The Cultivator is truly the farmer's friend. It is not printed in the interest of the corporations or middle men. May it continue to grow until it reaches every farm in California." Regarding conditions in the San Joaquin valley Mrs. Marks further adds that many farmers are embarrassed by the exactions of the "M & L Corporation" which have kept finances in a strenous condition the last two years.

"The Virginia," owner, Joseph Clarke, Redlands, San Bernardino county. Mr. Clarke writes: "In reference to farm names would say we have decided to call our ten acre orange grove and home 'The Virginia' in memory of my old home in the Old Dominion. Our place is located on Colton Avenue and Nevada street, two miles west of Redlands. I think the naming of the farm an excellent idea. We appreciate most highly the Cultivator and could not keep house without it."

"Arbor Ville Ranch," owner, W. H. Condart, Holtville, Imperial county. Mr. Condart writes that Arbor Ville consists of 100 acres on which one of the first crops was sweet potatoes. "The arbor which leads to the name is covered with sweet potato vines too dense for the sun to get through. On the first of last March my land was a barren desert and now the shady arbor will be made the main feature of the ornamental part of the ranch. We are much interested in your farm names and think all farmers should give their place a name. Our aim is to make the ranch deserving the name we have given it." The writer further adds that their ranch is slightly above sea level which is contrary to most of the ranches in the Imperial valley.

"Rancho de Martinez," owner, Thomas R. Hanna, Martinez, Contra Costa county. Mr. Hanna has neatly printed memorandum sized letter heads and fine bond paper, carrying the information that choice fruits are the principal features of the ranch.

"Early Vale Orchard," owner, H. Kettenburg, Winters, Yolo county. Mr. Kettenburg writes: "In a way of suggestion I would like to say that we endorse the course of the Cultivator. It is always a welcome visitor and after reading it is filed away for reference. Our little farm contains 55 acres of which 15 is in orchard, of apricots, peaches, plums, figs, pears and apples, and about 10 acres we use for winter and early vegetables. The remainder is in pasture and in hay. We keep about 100 laying hens, the product of which is sold in San Francisco at 35 cents per dozen the year round. This is done by contracting with private parties."

"Cypress Avenue Fruit Vale," owner, Mr. & Mrs. D. S. Coyner, Los Alamos, Santa Barbara county. Regarding this attractive home Mr Coyner writes that it is about a quarter of a mile from the center of Los Alamos. "Six acres are planted in fruit trees, consisting of pears, apples, peaches, plums and walnuts. We have besides two small vineyards and nearly all the trees are in full bearing. Our home is a nice seven room house, has a good barn, outbuildings for storing fruit, lots of shade trees, windmill and tank, and we raise the finest kind of vegetables between trees."

"Canyada Verde," owner, A. M. Otis, Whittier, Los Angeles county. "The Cultivator is essential to our work here in this beautiful La Habra valley. Our Spanish name means Green Valley and that is certainly what we have."

"Alberta Orange Grove," owner, A. E. Rudell, Rialto, San Bernardino county.

"El Modello," owner, Charles F. Collins, Dinuba, Tulare county. Mr. Collins writes that he is growing on El Modello 105 different varieties of fruit and nuts, and that he can pick fresh fruit from the trees every day in the year. "Back home, in old Iowa they are in the icy grip of Jack Frost while we have bowers of roses on El Modello."

It is with pleasure this week that we are permitted to announce that Assemblyman Lawrence H. Wilson of the 16th district has taken up the matter of introducing into the present session of the California legislature a bill designed to extend the privileges of a trade mark law to farm names. The purpose of such bill being to protect such a name so the farmer may advertise his products under that name and be protected in the use of the name in shipping fruit, garden truck and other farm products.

American Live Stock Breeders Convention Program

THE twelfth annual convention of the American Live Stock Breeders Association will convene next Tuesday January 26, at ten o'clock at the Belasco Theatre, 335 South Main Street, Los Angeles.

The first session will be largely given over to addresses of welcome and response and to the annual address of President H. A. Jastro and to the appointment of standing committees. Hon. W. A. Harris, of Lawrence, Kansas, will, however, make an address on Our Foreign Markets.

Tuesday afternoon session will convene at two o'clock. Hon. J. A. Carey of Cheyenne will give an address on Land Laws; Hon. S. H. Cowan, Attorney for National Live Stock Association, What the Live Stock Industry Demands of Congress; C. D. Marsh, Expert of Bureau of Plant Industry, Washington, The Loco Investigation. These addresses will be followed by a general discussion by all members on tariff on hides, wool and live stock.

Wednesday morning, January 27, Dr. O. E. Dyson of Chicago will give an address on Meat Inspection; I. T. Pryor, President of Cattle Breeders' Association of Texas, on Benefits Derived from Live Stock Organizations and Co-operation; Honorable Gifford Pinchot, Chairman of the National Conservation Committee, it is hoped will be present and deliver an address. The closing feature of Wednesday morning will be an address by E. S. Gosney, President Arizona Wool Growers Association.

Wednesday afternoon at two o'clock Dr. C. M. Haring, Veterinarian of the University of California will give an address on Live Stock Conditions in California; Dwight B. Heard, President Arizona Cattle Growers Association, Federal Control of Public Grazing Lands; J. C. Underwood, Wyoming, Secretary Laramie County Cattle and Horse Growers' Association, The Future of the Cow-man. The afternoon session will be closed with a general discussion of the administration of forest reserves and the proposed government control of the open range.

Thursday, January 28, at ten o'clock, will be the consideration of resolutions, followed by general business of the association, election of officers for the coming year, selection of the next place of meeting, etc.

Thursday afternoon will be given over to an automobile ride under the auspices of the Los Angeles Chamber of Commerce. This feature will start at two o'clock.

Beside the above entertaining features, a reception will be tendered on Tuesday evening, January 26, by the Chamber of Commerce, at its rooms, 128 South Broadway. On Wednesday evening, the Y. M. C. A. has extended the invitation to its athletic contest and a reception at its magnificent new structure, 721 South Hope Street. On Friday morning, trips will be taken to Pasadena, members reporting at the Pacific Electric Depot at nine o'clock for the start. On Saturday afternoon, January 30, members will attend the driving club matinees at Agricultural Park.

Among the important questions that will come up for consideration at this convention are: Tariff on hides, wool and live stock; extension of foreign markets for live stock and meat food products; railroad legislation, covering railroad service; prohibition of advances in interstate railroad rates except upon approval of Interstate Commerce Commission; a minimum speed limit for transportation of live stock and perishable freight; meat inspection and sanitary condition of live stock; federal control of the unappropriated open range suitable only for grazing; administration of forest reserves; also other questions of interest to live stock people.

KEEP HOGS FREE FROM WORMS.

A Missouri correspondent writes: "I am fattening a small bunch of March pigs. I am feeding them all the new corn they will eat, together with a liberal allowance of ground rye and skim milk. In addition to this ration they are being fed some pumpkins, as the pastures are dry. Would you advise feeding anything to prevent worms? If so, what?"

We believe it is always a good plan to feed hogs something that will keep worms away. This comparatively few farmers do. We have frequently visited the slaughterhouses here in Sioux City and elsewhere, and there have become impressed with the fact that the great bulk of the hogs that reach the market are affected with worms to a very large extent. Sometimes their intestines are so filled with these pests that one wonders how they manage to live. There are a number of good worm remedies on the market.

A hog that is infested with worms cannot produce pork economically, because its system is not in normal condition. Furthermore, such a hog is also more susceptible to contagious and other diseases than one not affected in that manner. We have often made the statement that worms are frequently the indirect cause of cholera. Do not understand us to say that worms will produce cholera. Far from it. Cholera is a germ disease and can be produced only by the cholera germ, but a strong, vigorous hog is not nearly so susceptible to cholera as is one whose system is in a run-down condition.

A very good, practical remedy for worms consists in feeding one pound of copperas to 100 pigs for a period of five days. Then feed no copperas for six weeks; after that feed copperas for five days again as before and continue this intermittent copperas feeding from birth to block. The copperas should be dissolved in water and mixed with the grain, preferably ground grain of some kind. Many hog feeders are using this remedy and recommend it very highly.

SUCCESSFUL SALE.

The sale of high bred Shorthorn cattle made by the Howard Cattle Company and Mrs. J. H. Glide at Woodland on January 5, resulted in the sale of 62 head of exceptionally fine stock. The average of the 62 head was $157, or a total of 9,775 for the 62 head. The 23 head of cows sold for a total of $3,390, an average of $147 per head, while the 39 bulls sold for $6,385, an average of $163 per head. The highest priced single animal was English Lady Fifteenth, bought by J. W. Goodwin of San Francisco. This animal commanded $510. Mr. Goodwin also carried away a fine bull Ed. Lancaster, 299834, a youngster calved November 6, 1907, for which he paid $450. T. B. Gibson of Woodland captured Glides Gloster Second, for which he paid $400. Other stock were purchased at prices ranging from $100 to $300. Amongst the purchasers of these fine animals we noticed S. H. Cowell of San Francisco, B. Bloss, Atwater; Sam Aftergut, San Francisco; J. F. Dunne, Hollister; J. W. Goodwin, San Francisco; T. B. Gibson, Woodland; Leslie Symmes, San Francisco; Grenada Ranch Company, Montague; Kern County Land Company, Bakersfield; Henry Able, San Jose; Joerger Bros., Clarksville; William L. Newhall, San Francisco; A. W. Foster, San Francisco; George L. Dillman, Anderson; F. Steinzel, San Lorenzo; W. M. Van Arsdel, San Francisco; George Chandler, Baker City, Oregon; W. F. Dillingham, Honolulu; W. G. Rossi, Slatington.

The Sacramento Valley Development Association is hoping for the appointment of a commission by the governor to act in conjunction with the commission appointed by the President which will have to do with the improvement of the Sacramento River and its tributaries.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

THE FARM SEPARATOR.

AT THE latest Creamery Operator's Convention the farm separator came in for a good share of attention at the hands of the various speakers. It was certainly not considered as an improvement. The responsibility for all the bad creamery butter that has troubled the markets lately, was held to be its fault. Now the fact is that this way of handling cream has come to stay, and the ways of handling it must be met. The situation is about like this. I visit many creameries during the year, and I am of the opinion that the butter maker is often a routine man who cannot meet an emergency. The old time butter maker who took the pan skimmed cream he could get, and made it into first-class butter, possessed a greater knowledge of actual cream than the present butter makers. They must learn to know cream quickly at sight. Under the system of receiving the sweet milk at the separator, putting it through the separator, and into the ripening vats and then into the churn resolved itself into a simple mechanical proposition of time, temperature and good temper on part of the butter maker and his helpers. Now comes the trying out. If the butter maker is worth his fancy wages, he can handle the cream from the farm separator.

Handling.

The farm cream arrives at the creamery where it is inspected, and if a man knows cream he should be able to put it in a vat with its kind. Then with proper cooling rooms and the use of an acid test it can be worked off all right. Cream that arrives too bad for use should be sent back just as the milk used to be sent home. The butter maker did not have to receive unusable milk, neither will he be obliged to receive bad cream. The test for acidity it has been contended must be used for every little batch of cream as it arrives at the creamery. This is unwarranted by the facts of the case. Two or three vats should be in use and after the fat sample is taken, put the cream into the vat that it is nearest like. After the cream is well stirred it should be chilled and then tested for acidity, and if ready may be churned at once. The cream should be graded as No. 1, 2 and 3, and churned separately, and sold as 1, 2 and 3 grades of butter. Then divide the prices among the producers of the cream according to the price of the resultant butter. Let the man with No. 1 cream receive No. 1 prices for it, and let the man with No. 3 receive grease prices for his.

Justice.

The low price brought by the poorer cream would soon bring the dairy man to time. If he chose to go to the next creamery, let him go, for he is not worth much to the creamery any way. Back in Wisconsin it is rather amusing to hear the children; they speak of their father's farm with pride, as having been a condensary source of milk. They quite look down on the neighbor who is only a butter creamery man. Why should we not foster the same pride in our people? We can do it by paying for cleanliness. Why should we not pay for cleanliness? The careful man that sends in clean, pure cream spends more money than the slovenly man who is content with any old sort of stables. Cleanliness in the cow stables means cement floors, Gypsum spread daily, all manure hauled out and extra wages allowed to picked out milkers. How sensitive are the milkers to any criticism of their ways! They often have the large dairyman at their mercy. The Japanese crews are terribly set in their ways and do not have any conscience about leaving in a bunch. It has always seemed to me that a cruelty charge could be laid to the milkers who leave without cause, for the cows suffer from going unmilked. It is certainly cruel to the owner. Now the worry of handling a large herd of cows is greatly increased if the owner enforces cleanliness. I presume it is a knowledge of guilt that makes people touchy about this matter. To call a patron dirty has cost the butter makers a job sometimes, in the creamery, while to tell a farmer's wife how poor a cook she really is, did cost one Farmers Institute speaker a place on the force. These things must be said and it is not a poor test of the man or woman who can clothe an offensive fact in polite, inoffensive language.

Modern Virtue.

Personal cleanliness is certainly a modern virtue. While many will contend that it was not possible that the Revolutionary dads were not as well washed as their grand children, still, we remember the farm house way, of filling the old wooden tubs with hot water on Saturday night for the dreaded weekly bath, and then think how we of today have our porcelain tub of hot water every night for cleanliness and the cool morning tub for refreshment and do not consider we are over clean then.

Modern Improvements.

The milking machine seems to have again dropped out of sight, but it will come when the need is great enough. We are now thinking of developing the electric power to help us out on the ranch. Electricity can be made to save considerable labor. Out at the Kearney place, now left to the University for a State School, electricity has been applied to a number of uses. The engines are run every evening and furnish light until nine o'clock doing away with the risk of fire from lanterns, pumping the water at the same time. On the ranch we will try the utilization of the water flow to run small plants for pumping out drainage water, to pump well water and to pump for irrigation. By establishing a central plant and wiring the ranch by degrees the whole can be brought into operation. The work of pumping out water fortunately comes at the time of year when the water is in the canals. The lighting up of the houses as well as barn will be a part of the improvement. There are so many uses for electrical power on a farm that it is only a matter of time until the large power companies will supply it to us. The separator, milking machine, vacuum house sweeper, as well as fans for the houses and for the cow stables are all within easy reach. The farmers need not do without so many things that he does not have, if he will utilize the forces at hand instead of wishing for the things of the city. The person who lives in the country has so many things that even the wealthy do without in the cities. I feel when I return home from a stay at wealthy homes in the city, as though I lived a life of luxury with horses and carriages and men to do my bidding at every turn.—M. E. Sherman.

HOW TO PRODUCE BACON.

There has been a marked increase in the demand for bacon within the last few years. The amount exported, including hams and shoulders, is much larger than any other kind of pork. This gives an idea of what those who buy our pork abroad want, and it may be well to give the matter of its production consideration. In studying the home market we also find a growing demand for this meat. The live weight prices for bacon hogs weighing from 170 to 200 pounds have been more in favor of these than of the large fat lard type. For cured meats the difference is even greater. In our home market we pay the extra price in order to gratify our taste.

It does not require great powers of discrimination to see that a large per-

Portland eggs are now quoted at 42½ cents.

centage of the meat offered and sold for bacon is not of the best quality. With the most of it there is too large a proportion of fat. People are becoming more and more exacting and the discrimination against the nearly all fat strips is becoming very marked. For first-class bacon the rule requires three streaks of lean intermixed with fat. There are three breeds of hogs that are well fitted by their physical makeup to produce first-class bacon—Berkshire, Yorkshire and Tamworth. It is an erroneous idea that any of the breeds fed along slowly to the desired weights make first-class bacon. There must be an inclination on the part of the breed to produce a large percentage of lean meat, and the ideal bacon hog must be long and deep sided. We have entertained a decided preference for the Berkshire, not only on account of the abundance of lean on the sides, but because they produce superior hams that sell for a high figure.

There seems to be an opinion that the pigs destined for bacon must be fed along slowly until they have reached the required weight. This is a mistake. It should be borne in mind that young animals develop muscle while growing and not after; therefore, in order to secure the best results they must be fed with the object of rapid growth in view from the start. It is a good plan to encourage them to eat when three weeks old and feed them scalded middlings mixed with milk while yet warm, in a little trough where they can get to it and not be interfered with by larger animals.

Clean the trough each time before putting in the next feeding. Keep the appetite good by giving only as much as they will eat up clean. As they grow along, coarser feeds can be mixed in, such as corn and oats ground together, with the hulls sifted out. Barley, peas and rye make good feed to mix with the other feeds. Rye is sometimes cheaper than middlings. The main thing is to make the feed palatable and keep it well balanced with protein enough to make blood and muscle as well as fat. A good ratio of protein to carbohydrates is one to six in winter and one to five in summer. A grass run in summer and clover hay in winter help greatly and make the feeding less expensive. —Farmers' Tribune.

A POPULAR ERROR.

In the handling of live stock I do not know of a mistake so common among all classes of men, aside from the veterinarian, as the one connected with the common colic of the horse. Scarcely without exception, when the horse is cramping from colic, he is thought to have something the matter with his kidneys. Cramps in the intestines from accumulation of gases or some irritating food cause him to stretch himself with the fore and hind feet wide apart. No doubt this gives some relief by tightening the muscles across the abdomen. It is not an indication of any fault with either the kidneys or the bladder. It is a physiological fact that spasm in the bowels acts reflexly upon the bladder, making this latter organ inoperative for the time being. The remedy, in almost every case, is nitre, or some remedy directed to relieve the bladder or the kidneys. The correct remedy would be to give a purge to remove the irritating substance from the bowels, and anodynes to relieve the pain. The bladder, except in cases of long protracted colic or inflammation of the bowels, will take care of itself. Diseases of the kidneys are quite rare in the horse, and when they do appear seldom come with an acute attack. Remember, then, if the horse is rolling on the ground, getting up and lying down, bloated, and stretching himself out, the chances are a hundred to one that it is colic, or some other disease, and no fault whatever with the bladder, although his actions might indicate a distention of that organ.—Geo. H. Glover.

FITTED TO LESS THAN A HAIR'S BREADTH
De Laval Cream Separators

When you buy a DE LAVAL Cream Separator you buy mechanical perfection. You get the product of the greatest painstaking mechanical skill and the finest of manufacturing tools. Of special note in this connection is the fact that the bearings and revolving parts of DE LAVEL machines are fitted to less than the one thousandth part of an inch, or, in other words, to about one-fifth the breadth of a human hair. Such a degree of exactness is invisible to the naked eye and can only be determined by the finest of gauges. It is nevertheless the set standard to which all DE LAVAL spindles and bearings must be fitted. Any parts which do not come within this degree of accuracy are thrown aside by the DE LAVAL factory inspectors and much material and many hours of work are sacrificed in this way annually. It is this very sacrifice, however, that makes the DE LAVAL cream separator so extremely durable and capable of lasting from fifteen to twenty-five years under the hardest of farm usage and of always doing easily the very best work under any and all conditions. It is the reason for their remarkable ease of operation and absolutely perfect working in every part. No other separator or farm implement made today has anywhere near the care, time, or expense devoted to its manufacture that the DE LAVAL has. When you buy a DE LAVAL you get the best that money can possibly buy and skill can make in a cream separator way. Moreover, you pay less for it than for any would-be competing separator of similar actual capacity. The DE LAVAL catalogue explains and illustrates these all important points. It is to be had for the asking. Write today.

TRICKERY OF IMPORTERS.

After long association with various men in the mining camps of early California days Bret Harte came to the wise conclusion that,

For ways that are dark and tricks that are vain,
The heathen Chinee is peculiar.

The grape grower in California has reached the conclusion that John Chinaman has not yet secured an entire monopoly on the ways that are dark. They show us as evidence the petition recently filed by Eastern importers of fruits from Spain that these same importers have ways of their own that are also very peculiar. Peculiar in this, that the petition does not state a condition which does prevail in the great importing business and does not prevail in the grape-growing districts of California.

On deciduous page of this week's issue of the Cultivator will be seen a statement sent to this office by Mr. Robert G. Williams, Chairman of the committee recently appointed by the State Fruit Growers' Convention to look after the interests of California grape growers before the Ways and Means Committee at Washington. The work for which this committee was appointed was to prevent the importers from securing a reduction of approximately 53 per cent in the import duties on table grapes. The committee has now found that really the effort of the importers is to reduce the duties 100 per cent. In the petition which is headed by the large firm of Sgobel and Day, the statement is made that California "is not yet producing a large enough quantity to supply the demand," consequently the best interests of the poor consumer of the country demand that the Almeria grape shall be admitted free in the interests of these poor people. Imagine for a moment the poor people of the country buying Almeria grapes. Their price has been and will be, so far as any reduction might be made upon removal of the tariff, entirely prohibitive to them. Besides that the claim that California is not yet able to supply the demand is proved to be false by the results of last season's marketing. To be sure, we do not claim that the Tokay and other similar grapes shipped from California are identical with the Almeria. At the same time, with cold storage keeping of fruit, California table grapes have supplied the market until long after the holidays are past. This holiday trade is all Sgobel and Day claim they wish the introduction of the Almeria grape for.

The Lodi growers and some other sections are thoroughly alive to the situation and the wires have been kept warm with protests against any such action, and Congressman Needham is doing his best at Washington to aid the grape growers.

At the very best the California grape grower is handicapped by the freight charges being so much greater from California than they are from Spain. The tariff is only a partial protection or aid in overcoming this difference in freight. If denied this protection, disaster will surely come to the table grape industry.

FARM NAMES.

The Cultivator has just received a letter from Assemblyman Lawrence H. Wilson of the 16th District in which he says, "I intend to introduce a bill designed to extend a trade mark law to farm names, that such names, when used as trade mark or brand for the sale of fruit or other products, may be protected." This is certainly a wise move and will give to every farmer a material advantage in having a protected name for the ranch and be in addition a spur to him to produce as high a grade product as possible that his protected name might become a more valuable asset in his farming operations. We believe a similar law prevails in Missouri and possibly in some other states of the Union. We cannot conceive where any possible exceptions can possibly be taken to such a law, and it should surely not require a great lobby to carry it through. It would not necessitate any material expense for the recording of these names and issuing the permits to use them to the farmers and would be a clerical task of so small moment that its burden would fall lightly upon any department of the state government where it was placed.

Mr. Wilson requests that farmers having ideas regarding the features of this law write him, with any suggestions which may appear wise. Once it is definitely before the legislature it will perhaps be wise for everyone feeling that such a bill will be an advantage to the farmer to write to the various assemblymen and senators urging its support.

DEMONSTRATION TRAIN.

It now appears that all sections of the state touched by Southern Pacific lines will be given an opportunity to inspect the demonstration train which has already made the circuit of Sacramento valley and will soon be on its second trip through the San Joaquin valley. Later in the month it will touch Southern California.

This train is made up of several cars, two of which are used for exhibit cars, showing different methods of work and various farm products which have lessons for the producer. The train is accompanied by lecturers from the State University who give information along fruit growing and farming lines.

DRY FARMING CONGRESS.

Preparations for a great assemblying of "dry farmers" at Cheyenne, February 23-24-25, at the Trans-Missouri Dry Farming Congress, are practically completed. A letter from Secretary John T. Burns, of the Board of Control, Cheyenne, announces that some of the brightest minds of arid America will be present and that this will prove the most important congress held by this organization. Any person may become a member of this congress for a nominal sum, in consideration of which the bulletins of the congress are mailed as fast as issued. The congress wishes the name of every dry farmer of the west and will appreciate getting in touch with those who are interested in learning more as to culture of arid lands.

ALL FOR A DOLLAR.

Subscribers of the Cultivator often remark about the amount of matter which is given for the small sum which is asked on subscription. "The biggest and best for the least money" is a remark often made. Last week's paper required thirty two pages to hold the amount of good reading matter which we knew our subscribers would require. This week is twenty four and next week another big thirty-two pager is coming. In it there will be an article by an Australian subscriber of the Cultivator on Eucalyptus Culture, written especially with reference to the giant of all eucalyptus trees, Amygdalina regnans.

A lot of queries which are held over from this week will be given place by the larger edition. It may be noted this week that three pages are given up to these queries and their answers. This is becoming one of the strongest departments of the Cultivator.

Then there is Mrs. Sherman's Department, which is always exceptionally good. Mrs. Sherman says things in a way which gives information and is at the same time most delightful reading. Mrs. Sherman's article next week is "Ranch Doings." It isn't exactly all about the dairy, nor even entirely about live stock, although it will appear in that department, but in it is a fund of information which every rancher will appreciate.

Mr. Mills will touch upon Deep Cultivation of Vines which will be very timely. Other factors we will not take the time to enumerate, but bear in mind that "the biggest and best for the least money" is one of the mottoes of the Cultivator.

NATIONAL LIVE STOCK ASSOCIATION.

Los Angeles is making extensive preparations for the twelfth annual meeting of the American National Live Stock Breeders Association, and the Chamber of Commerce, Y. M. C. A., and other bodies in the city are planning to give the attendants the time of their lives. Secretary Tomlinson informs us that promise is made for large attendance and much interest has been manifested in correspondence and in suggestions for the meeting. Talented speakers from sections all the way from Washington, D. C., to San Francisco, are on the program.

ELEVATE THE BENCH.

There is one movement before the California legislature which should succeed this session. That is, the plan of taking the elections of all judical candidates away from party affairs. If adopted, the plan is that the names of candidates for the judiciary shall be given in a column separate from any party column, without any indication of the party affiliations of the candidate. Such a move can only result in the election of men of a higher type than has been possible under party domination.

FARMERS INSTITUTES.

J. B. Neff, Conductor of Institutes of Southern California, reports coming institutes as follows: Toluca, January 25; Gardena, January 26; Montebello, January 27; Fillmore, January 28-9; San Fernando, January 30.

Shop Talk

FARM BOOKS.—The Cultivator caters to the rancher along the line of farm books, and is always ready to give the advantage of any discount obtainable. For instance note the following copied from our 1909 clubbing list. All orders must include a year's subscription to our paper and the price given is for both. Books are also post paid so that no other expense is incurred. Send in your orders.

A. B. C. & X. Y. Z. of Bee Culture	$2.35
The New Agriculture	2.50
Feeds & Feeding	2.50
American Grape Growing and Wine Making	2.25
Poultry Standard of Perfection	2.35
Perfected Poultry of America	3.00
Campbell's Dry Farming Manual	2.50

The Cultivator included 1 year at the price.

Agricultural Notes of the Pacific Coast

Northern California

Cloverdale Citrus Fair will be held February 17-22.

Lakeport was recently visited by quite a severe snowstorm.

Yolo county has more grain sown than last year at the same date.

A large mill for making alfalfa meal has been established at Red Bluff.

Petaluma shipped nearly four and a half million eggs last year and 59,000 dozen poultry.

Two men near Healdsburg recently died from anthrax contracted while skinning a diseased cow.

Many cars of eggs have been received from Middle West points during the recent high prices.

The fall of snow at Meadow Lake, Nevada county, aggregated seven feet in the streets of that town.

Cherry trees of the Sacramento valley are in some sections being affected by a new disease called "cherry die back."

Marin county shippers of butter are increasing their shipments to San Francisco under favorable weather conditions.

Upper Matole, Humboldt county, has had over 25 inches of rainfall this year. This is about nine inches short of the average.

Shippers at Petaluma are working for a $15,000 appropriation in the State Legislature for the improvement of Petaluma Creek.

The Blackberry Growers Association of Sebastopol is considering a plan of incorporation in order to market fruit more satisfactorily.

The premium list for the Cloverdale Citrus Fair shows $75 first prize for the best display of oranges and lemons from one community.

The Tehama Live Stock Association in a meeting held at Corning recently passed resolutions endorsing the construction of the dam at Iron canyon.

The Tehama county stock association has appointed an advisory board to co-operate with the Forestry Service to work in harmony with it in the control of the forest reserves.

The plant introduction garden at Chico has just established in the gardens a 140 ton shipment of all kinds of bamboo brought directly from a large nursery in Japan. The government will propagate from this for a few years and then distribute.

One of the heaviest and longest continued storms that has visited Northern California resulted in the highest water which the rivers have shown since cultivation has become extensive. Many bridges were washed out and levees broken so that much valuable farm land is now under water.

The grange of Petaluma has installed officers for the coming year as follows: Master, M. D. Winans; Lecturer, Mrs. Alma Walls; Chaplain, Mrs. C. D. Grover; Treasurer, Mrs. E. G. Bennett; Secretary, Miss Cassie McGlynn; Steward, Mrs. A. S. Hall; Lady Assistant Steward, Mrs. M. D. Winans; Assistant Steward, M. D. Hopkins; Ceres, Mrs. Skiffington; Pomona, Miss Alice Kelsey; Flora, Mrs. Porch.

Central California

An orange grower at Exeter received as net returns for holiday fruit shipped, $644 for one car and $590 for the other, both being rather small cars.

The cry of the packers that over production of grapes is the cause of the present low prices is not accepted by the growers as being made in good faith.

County Entomologist Morris of Santa Clara county is one of the busy members of the newly formed Central Coast Counties Bee Keepers Association.

Horticultural Commissioner Sharp of Kings county calls the attention of planters of vines and trees to the horticultural law and insists on its rigid enforcement.

A bill recently passed the United States Senate for the purchase of private lands in eastern Tulare county which are covered with a Sequoia grove of big trees.

Grape growers at Lodi and other sections of Central California are up in arms over the efforts of the Eastern importers to secure free importation of Almeria grapes.

The annual meeting of the Fresno County Farmers Union was recently held and it was decided to ship dried fruit and raisins for members of the Union direct to eastern customers.

Lindsay has an orange which was shipped with a box of fruit during October to a point in Michigan, purchased at the fruit stand there and returned by mail and is yet in fair condition.

Stanislaus county reports that from present indications the grain and hay crop of this year will be much in excess of that of last year. The showers have been well distributed and the grain is now in fine condition.

According to the line of work laid out for the raisin combine it has run in contact with the regulations of the Cartwright law and a halt has been called until some different line of action may be taken up or the Cartwright law repealed.

Notwithstanding the raisin growers are up against the Cartwright law they are continuing to secure signatures of raisin growers to the contract. They confidently expect to arrange matters so as to save the valuable work done toward perfecting this organization.

Santa Clara Valley prune growers who have been concerned as to the prevalence of the red scab are demanding an investigation as to its cause. Some have maintained it was due to the thrips but many growers are asserting that such is not the case, it is merely a fungus and must be treated as such.

At the last regular monthly meeting of the Santa Clara Valley Poultry and Pet Stock Association officers were elected for the coming year as follows: President, F. E. Mann; vice-presidents, F. E. Baldwin, George A. Sealy, E. K. Glendenning, V. H. Richards, R. A. Robertson; directors, Henry Berrar, Joseph T. Brooks, W. S. Sullivan, E. R. Everett, A. B. McKean; secretary, Charles R. Harker; treasurer, E. Van Every; auditors, H. M. Billings, George Leaman.

Southern California

Imperial Valley is shipping much hay.

San Diego county has about 50,000 head of cattle.

The celery crop was greatly benefited by the recent storm.

San Diego county has about 11,000 acres in wheat, 20,000 in barley, and nearly 4,000 in oats.

The Highland plan of insurance against scale is spreading to other sections of San Bernardino county.

San Diego is not a raisin county but at the same time it produced last year over 4,000,000 pounds of very fine raisins.

A Fullerton chicken raiser shows his itemized accounts to prove that his hundred Rhode Island Reds netted him $300 last year.

The recent storm has delayed the shipments of citrus fruit, which will be a good thing for the market, which had become somewhat weakened.

Arroyo Grande has been wonderfully benefited by the showers of the last few weeks and vegetation is now in advance of last year this same date.

The Fullerton cabbage growers are discussing a contract offered them by a new shipping firm. Owing to some objectionable features it will probably not be largely signed.

The La Habra Vegetable Growers' Association in its annual report shows that a large part of the crop of tomatoes was delivered at the La Habra packing house, netting $40 per ton.

The cantaloupe acreage about Imperial will be vastly less than last year. Many of those who formerly engaged in the industry are now transferring their energies to live stock.

A new railway in southwestern Ventura county known as the Malibu Railway is now delivering beans for bean raisers in that section much more economically than former long hauls.

Southern California has been visited during the last few days with showers which have done a world of good. The rain has been light but coming so slowly has penetrated the ground very deeply.

At the annual meeting of Water Company Number One of Imperial valley, it was reported that that one company has under irrigation 82,000 acres of land for which they have 135,000 acre-feet of water.

Cattlemen of San Luis Obispo county are seriously concerned over the rigorous enforcement of the quarantine law which they maintain is unjust because the dipping as performed in that county has been ineffective.

Southern California oranges recently sold in Philadelphia for one dollar apiece. It must be added, however, that this fruit was part of a car given for the benefit of the Italian earthquake sufferers. The entire car brought $2550.

Wild ducks killed by the members of gun clubs near the big San Joaquin ranch have long caused wonder by their exceptional fatness. This has finally been found to be due to their raids upon lima bean fields belonging to neighboring ranch people.

The Coast

The fruit growers of Idaho, recently met in annual session at Caldwell.

Arizona cantaloupe growers will grow practically no cantaloupes this season.

Scions of Winter Nellis pears are being shipped from Coeur d'Alene to fruit growers in Iowa.

The state manager of the Farmers' Union of Washington is organizing a new union at Sprague, Washington.

A meeting of the Farmers Union of Washington and Idaho has been called to meet in Spokane on February 9.

Portland is building a new live stock pavilion. It is of brick and 65 feet high and will seat 5800 people.

The state legislature of Idaho is being petitioned to increase the appropriation for payment of inspectors of fruit trees.

A big exhibit of bees and honey will be made by bee men of Yakima county, Washington, at the Alaska-Yukon Exposition.

The Hawaiian Islands prohibit the importation of pineapple plants from Australia, owing to the fear of introducing injurious insects.

Twenty varieties of apples, shipped from Idaho to the recent horticultural congress at Council Bluffs, Iowa, won seventeen first premiums.

The Yakima county poultry show recently closed a successful annual show at North Yakima. Judge Denny of Syracuse placed the ribbons.

The Yakima Commercial Club is purchasing six carloads of Yakima fruit which will be sent east and distributed free as part of an advertising campaign.

A beet sugar factory is promised the farmers at Farmington, Washington, and contracts are being signed up for delivery to a factory which will be built at Waverly.

The Agricultural Department, which is working in the Hawaiian Islands, is endeavoring to secure colonization of American farmers to develop resources of these islands.

The levee on the eastern side of the Colorado River near Yuma was found insufficient to keep the recent high water within bounds, and much agricultural land was injured.

At the recent meeting of the Hawaiian Rubber Growers' Association, report of the officers of recent work showed the industry to be established on a profitable basis in those islands.

A recent cold spell of Western Washington was the coldest in its history according to the oldest inhabitant. In Portland the temperature dropped uncomfortably close to the zero mark.

Summer fallowing is said to be responsible for the destruction of prairie chickens in the Idaho country and the hunters are making effort through the legislature to devise some means of protecting this game.

Farmers all over eastern Washington are organizing horticultural marching clubs which will take part in a great industrial parade at the opening of the 17th National Irrigation Congress to be held in Spokane next August.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards, and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

S. E. Gregg East Adams St. Riverside, Cal.

White Wyandottes

My San Jose Winnings: 1st, 2nd and 3rd Cock; 1st Cockerel; 1st, 2nd and 3rd Hen; 1st and 2nd Pullet. The above winnings were made out of ten entries.

Box 60, R. No. 1 Mrs. C. D. Hubbard San Fernando, Cal.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

LINE-BREEDING VS. IN-BREEDING.

PEOPLE want to know what is the difference between line-breeding and in-breeding about this time of the year, and it is right that they should be enlightened. Now there is a difference, but it is about as hard to explain as the difference between Christian Science and Spiritualism, yet all will admit that there is a difference.

What is it? One says we are all spirit and tries to so spiritualize us that we are free from the ills of the flesh. The other says it is possible to materialize the spirits of our departed friends, so that we may have communion with them while in the flesh ourselves, and both have trouble.

Well, now, line-breeding is the scientific mating of closely related specimens with the object of perfecting certain characteristics in a particular strain of birds, and must be done by a specialist to be successful.

In line-breeding father is mated to daughter, mother to son, grandparent back to grandchild, and a table kept, or that is, a record of each individual, like a family tree, so that the males are raised from one family and the females from another without the cross-breeding of brother and sister and cousins. Charts showing how this can be done are published from time to time, or can be found in most books treating on the breeding of fine poultry.

In-breeding is another thing, as it is usually understood, and means that males and females from the same flock are mated indiscriminately together without any regard to whether they are brothers and sisters or cousins, and soon results in smaller and weaker chicks, and infertile eggs.

Where one has not time and patience to line-breed very carefully, fresh blood in the shape of new males should be used every alternate year, at least. One may safely use the same male two years in succession, but after that a new one should be substituted.

If one has an extra good strain of fowls and does not want to introduce fresh males direct, buy a new hen from some one who has as good or better stock than oneself, mate her with a fine male from one's own stock, and use the males from this mating with one's own full blood stock.

The females may be used with their father again, and thus two families built up, from which one can select and mate for improvement, according to the chart. Experiments like this are what make fanciers, and is one of the most fascinating studies one can undertake.

I once met a very learned Doctor, who experimented in animal breeding, and worked out theories he formed from his studies of the human race.

He had an idea that "first impressions were most lasting," and that matings lasted longer than most people believed, basing his opinion upon his observations. He said he noticed that a woman's first husband affected the children she bore during her whole life. He invented a system of animal breeding which he called "Crossing and Moving away" which was considered the "sensation of the century" at the time. He had a flock of white sheep and wished to put black faces upon them without spoiling other "points." He obtained a ram resembling his own in all respects but the black face, mated that ram with his ewes one year, and killed every lamb from that mating. The next year he mated his ewes back to a pure bred ram of his own kind, and behold! over half of the lambs had black faces, proving his theory correct.

Now he told me, if I let my chickens all run together until they matured, the cockerels would mark those pullets for a much longer period (if not for life) than I suspected. This seems a little far-fetched, but let us consider: The blood of the foetus and of the mother commingle during pregnancy, therefore she partakes of the blood of the parent through the unborn offspring during all this time, and how far-reaching this influence is, we cannot guess. There are more laws than Mendel's governing heredity, and we cannot hope to learn all in one short life, but I certainly did take more care about separating the sexes of my chicks after talking with this wise old doctor, and results repaid my trouble.—Mrs. Frank Metcalf.

CHICKEN CHAT.

Acorns for Hens.

I should like to inquire through your poultry department whether, in your opinion, the eating of live oak acorns by hens, would tend to prevent egg production. I moved here near Morgan Hill, the middle of last October; of course the moving of my hens stopped eggs for a few weeks, but a band of about 100 pullets soon began laying, and when getting 18 to 20 a day, they suddenly began to decrease, and about this time I noticed that they were devouring the live oak acorns, and up to the present time they have not got back to where they were in the number of eggs.

Another flock of older hens have begun laying. I notice as soon as the houses are opened, they gobble up every acorn which has fallen over night. I notice also, that some, at least of the pullets mentioned, appear to be lightly moulting. The whole flock look in a fit condition to lay.

Also, I noticed that several of my old hens when heavily moulting, apparently went nearly or quite blind. How can you account for that? My flock numbers about 325. They have free range, and are fed according to rule, and have an excellent appetite.

Would mention in regard to the blindness, that I could see nothing like soreness about their eyes, but they appeared just unable to see. —E. A. C.

Do not think the acorns were at fault about the laying, but believe the pullets did as many other pullets are apt to do, lay a few eggs and then take a vacation. It is provoking, but natural, especially, if they moult the least little bit. The blindness of the hens was probably due to moulting, and only of a temporary nature, was it not? If permanent, it must have been caused by some weed they encountered in their search after goodies on free range.

Believe when those pullets begin again, which will likely be soon, that they will make up for lost time, and the eggs will be better for hatching than if they had continued on duty all winter.

I have just had a letter from one of, if not the most successful poultrymen in the State, to the effect that his hens and pullets had not paid for the last four months. Some way this last winter has been a trying one for chickens.

* * *

Goose Requires Green Feed.

I have a goose which acts as if it were paralyzed in the back. It runs a little ways and then falls down with its wings out flat and quivers all over. It eats and drinks well. Has been that way about a week. A lady told me she had two that way, and she thought they got hurt in their heads.—Mrs. H. K.

I believe your goose has liver trouble, which causes symptoms such as you describe, and is brought on by too much grain, and not enough green food. A steady diet of wheat will cause it as quickly as anything, a goose being naturally a grazing bird.

One of "Cap Johns Orderly's" or an equally prompt acting pill will sometimes help such a case, but a change of food is necessary to effect a cure. Bran mashes, with plenty of grit and green food are called for, with grain used very sparingly for a while.

She may be egg-bound. In this case, sweet oil should be applied to the vent liberally until relieved.

DRESSING MARKET FOWLS.

Poultry intended for market should always be plucked, unless the market demands otherwise, as plucked fowls, as a rule, are more salable than those unplucked, says a writer in Petaluma Journal. They should not be given any food for a period of at least 24 hours before being slaughtered in order that the crop and intestines may be emptied. They should be given a small quantity of water just before they are slaughtered.

While some prefer to kill the birds by suspending them by the legs and with a sharp knife cutting across the roof of the mouth far back, thus severing the jugular vein, yet I believe that wringing the neck is the best method. This is easily done by grasping the legs of the fowl in the left hand and the head in the right, the back of the bird being upward and the top of the head in the hollow of the right hand. Hold the legs of the fowl against the left hip and the head strongly, at the same time bending it suddenly backward which will dislocate the neck near the head. Thus the fowl will be killed instantly. Then remove the head, after which the work of plucking should begin at once.

If two pickers work together they can pluck a fowl rapidly. First take out the quills in the wings and tail, then pull the remainder of the coarse feathers, strip the wings, as they cool most quickly; then the body and lastly the legs. In order to avoid tearing the skin, care should be taken to pull only small handfuls of feather at a time, as tearing the skin gives the fowl a very unsightly appearance.

The fowl should not be dipped in water under any circumstances. After all but the pin feathers have been removed the fowl should be taken down, laid across the knees and the pin feathers carefully removed. If to be sold undrawn the head should be washed free of blood, the wings folded close to the body and tied there and the fowl laid upon a table, breast downward, to cool, or it may be suspended with a cord, head down.

If beheaded and drawn, the head should be severed and the skin drawn over the bone and neatly tied there with a cord. Place the fowl upon a table, with its back downward, and remove the intestines from the rear.

Care should be taken not to break the gall bladder. Should the entrails accidentally be torn and their contents come in contact with the flesh, its interior should be washed out with cold water and the fowl hung up until it has become thoroughly dry.

Allow the carcasses to cool thoroughly, after which pack them neatly in clean boxes and they are ready for shipment. If the work has been neatly and cleanly done a good price is practically assured.

ARTIFICIAL INCUBATION.

For successful work it is necessary to have good incubators, good eggs, and good, common sense management. The same directions that apply to one make will not necessarily do for another. Neither can the same directions successfully fit all conditions.

But there are some matters that will generally apply to all incubators.

In the first place the machine should be strongly built of well-seasoned lumber. Next, it should be located in either a well-ventilated dry cellar, or in a double-walled room above ground.

The first proper step to be taken is to carefully follow the directions as given by the manufacturers. One or more hatches may be necessary to note whether the directions fit your conditions. If not, then there can be gradual changes made, as might be suggsted.

Important rules to remember are: Fill the lamps each evening and

BEFORE BUYING INVESTIGATE

IT COSTS NOTHING, write today for my FREE 148-page and 32-page SUCCESS incubator book. It contains valuable lectures on poultry and all about the celebrated SUCCESS INCUBATORS, and Brooders. The Success Incubator is certainly a great money maker; chicks that are hatched from the SUCCESS grow into money fast. The SUCCESS INCUBATOR is made of the very best material, is the most durable and the most easy to operate. We should be glad to send you one on from 30 to 60 days' FREE TRIAL. Write today for my FREE 1909 Incubator books. They may mean much to you. **E. E. McClanahan, 108-10-12 East Eighth St. Los Angeles, Cal.**

Coulson's Special Dry Chick Food

Makes Them Grow

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

GERMAIN SEED CO., Distributing Agents, Los Angeles, Cal.

never use oil of less than 150 degrees test.

Always begin a hatch with a new wick.

Have the temperature of the egg chamber as near 103 degrees as possible, and keep the incubator away from the sunlight.

Test on the seventh and fourteenth days. Study the air cells of the eggs to determine if moisture or ventilation is needed.

After the fourth day turn the eggs night and morning, up to the eighteenth day.

Keep the burner clean from dirt, and scrape the charred part of the wick in preference to trimming it.

Never turn up the flame of the lamp so high that it will smoke.

In placing the eggs in the machine, have the large ends pointing the same way, and never add eggs after the hatch has started.

Cool the eggs after the fourth day, by placing the trays on top of the machine, and laying the bulb of the thermometer on a fertile egg. As soon as the temperature has fallen to ninety degrees, return the trays to the machine.

If the air cell of the egg is unusually large, add moisture; if small, give ventilation. The air-cell on the first test should measure a quarter of an inch from the middle of the large end five-eights inch on second test, and three-quarters of an inch on the nineteenth day.

Incubating white and brown shelled eggs at the same time in the same machine generally results in unsatisfactory hatches. The shells of the former are thinner than those of the latter, and consequently require different treatment.

After removing the infertile eggs, in order to have an even temperature for the eggs in the machine, spread out the fertile ones in the trays so that they will occupy about the same relative position to one another.

In selecting eggs for hatching have them of a uniform size, neither too large nor too small. Also reject thin-shelled eggs, and those having a ridge around them, or round and poorly shaped ones.—Petaluma Poultry Journal.

BREEDING PIGEONS.

The fancy for pigeons, as it is called, stands on a different footing in many respects to the business of breeding them for commercial or market purposes. Doubtless such things as pigeon-pies are not now utterly unknown. If you should ever feast on them you may wish to become a squab breeder, if for no other purpose than to supply your own table with this luxury. It is now a frequent dish upon the tables of the wealthy and connoisseurs of good eating.

To the sick and convalescent at certain seasons of the year they offer an appetizing and digestible food, highly recommended by the highest medical practitioners. A nice young fat squab is a dainty dish for the sick and afflicted, and the number that are killed and used for this purpose extends into the tens of thousands. The frequent use of them in place of wild birds in leading first-class hotels and high-priced restaurants is simply immense. The number bred and consumed for dainty food by lovers of high living is beyond estimate in the aggregate. In fact the business of market squab breeding is a growing and profitable one to engage in as a specialty, or in connection with other branches of stock breeding.

This is a business or a branch of stock breeding that can be conducted profitably by nearly all fowl keepers or farmers.

Few for Start.

To commence the business of breeding them it is only necessary to purchase a few pairs to start with, as in and in breeding does not really affect them; but at the same time it must not be carried too far; this can be prevented by purchasing a few extra male homing pigeons occasionally to cross with your young birds, which will keep up the vigor and vitality of your stock at a small cost. The amount of care and cost of keeping is small. They require cleanliness about their coops, etc., and if bred in confinement a good supply of sand sprinkled on the floor, plenty of fresh drinking water and a shallow tub for bathing in hot weather. Their feed consists of small, whole corn, wheat, rye, buckwheat, barley, peas and oats; a little hemp, canary and millet seed are also good for an occasional feed and some soaked stale bread is good while they are breeding their young, or as a change of food for the breeding stock.

To mate them for breeding it is best never to allow them to select mates, but pairing them with the selection of a large size male and a medium size hen will result in good vigorous young. To mate them is a simple matter, and it is only necessary to divide a medium size box with wire netting and place cock and hen in each separate compartment for a few days longer when they will usually be mated, and have a strong attachment for each other.

WHY FAILURES COME.

It is a common occurrence for prospective poultrymen to set up in business with insufficient capital; and it is ridiculous to assume, as many do, that an investment of $500 will insure an income capable of supporting a family. Invest that amount in any other business and try to live off the income and see if you can succeed. Start small and if you have only a few hundred dollars do not give up your other work, but gradually add to your poultry yard and in time it will grow into a business which will enable you to devote your entire time to it. Then again others select locations totally unsuited and they fail. Others think that there is no work to do and fail through neglect. Begin small; do your work well and gradually grow as you have more capital to add.

FINE FOR NESTS.

Mr. Wm. Nelson of Orland tells us that he has found the following described nesting places excellent:

"The best hens' nests are made from five-gallon oil cans, cut open on one side in the middle and to each corner and the edges turned up and pounded down, and then set in a frame so they can't get out. I have used them a long time, and find them cheap and handy."

A strong movement of home seekers is being made toward the Palo Verde section on the Colorado River, some distance north of Yuma. Over 40,000 acres of this fine land is desired by a group of land seekers. It is near the Blythe ranch and has nearly all been filed upon.

Santa Ana farming lands are rapidly being seeded to sugar beets.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cornichon on St. George Root.

In a recent issue you advised E. M., of Newport Beach to plant Purple Cornichon on Rupestris St. George.

This combination has been quite extensively planted here (Alhambra valley) and without a single exception has been a complete and disastrous failure.

St. George and Tokay, St. George and Muscat and St. George and most wine grapes do well here, so the fault of St. George and Purple Cornichon is not to be laid to the fact that the St. George is not in agreeable soil.—Thos. R. Hanna, Rancho de Martinez, Martinez.

Dog Wash—Vanilla Extract.

I have two valuable dogs that are badly infested with vermin. Kindly tell me how I may destroy them. How is vanilla extract made, from the vanilla bean?—R. T., Sonoma.

(1). Wash the dogs once a week with a solution of one teaspoon creolin to one quart of water. There are many dog soaps on the market which do good work. (2). Vanilla, in fine bits, 250 parts, is put into 1350 parts of mixture, of 2500 parts of 95 per cent alcohol and 1500 parts distilled water. Cover tightly, put on the water bath, and digest for one hour at 140 degrees F. Pour off the liquid and set aside. To the residue in the bath add half the remaining water and treat in the same manner. Pack the vanilla in an extraction apparatus, and treat with 250 parts of alcohol and water, mixed in the same proportions as before. Mix the results of the three infusions first made, filter, and wash the filter paper with the results of the percolation, allowing the filtered percolate to mingle with the filtrate of the mixed infusions.

Garget.

About a month ago I bought a cow which had been fresh two or three months. At times small lumps and strings came out with the milk from two teats, more from one than the other. Just before passing these substances, the bag above those teats becomes hard, then softens up, but not naturally, like the other side. What is the trouble, what is the cause, and what is the remedy? Is she liable to dry up soon? She gives less milk out of the worst teat now than when we first got her. She is a good cow otherwise.—W. F. R.

I fear you have failed to milk the cow clean every single time, and now have a little garget to contend with. Bathe the udder with hot water or rub it well with hot lard and protect from the cold with a sack covering. Milk clean every time and the trouble should quickly disappear. Certainly if the milking out is not thorough the cow will go dry.—M. E. S.

Pruning Malagas.

Can you tell us how to prune Malagas?—W. J. M., Coachella.

Where can I get some book on pruning vines, especially Malagas? Are they pruned to stake up, or the same as muscats, only somewhat higher, from young to bearing?—S. F. D., Exeter.

In the young malaga vineyard, training them to a stake from a year old will make an erect, straight growing vine. The first year's pruning is to cut them to a single straight cane. The second year's pruning, the central cane is left a foot long and tied up to the stake. The stakes are four feet long and driven into the ground a foot. Each year this center or leader is carried up a foot or more until it reaches the desired height of the vine. The height best liked is about three feet. The side spurs are shortened in each year. It is best to have only one stem or trunk to a vine. This heads the vines three feet from the ground with the lowest spur a foot from the ground. While the vine is young, if it is desired to have it very perfect it may have the lower shoots taken off from within a foot of the ground by rubbing them out. Be careful in leaving the spurs to do so in a way that will balance the vine all around. Stake with the four foot stakes just as soon as the vines are long enough to tie up. Prune to leave two to four buds on each spur of new wood. The spurs are left four to six inches long and eight to twelve spurs are not too many for a mature vine. When vines have matured they become strong enough to stand alone and then the stakes may be removed. —M. E. S.

The best information on pruning is The Pruning Book, by L. H. Bailey. It treats of trees as well as vines, but is not from a California standpoint.

Bacteria in Milk.

My cow is in good condition, seems perfectly healthy, is fed on best alfalfa hay and a pail of dry bran morning and evening. Gives large mess of milk, but after the milk stands 24 hours, there is in bottom of pan about one half an inch of thick, stringy, sticky substance like a thin sweet milk curd.—C. J. G., Santa Ana.

I should suggest the trouble was in the developing of the slimy bacteria. These appear in milk that is kept below the point at which the lactic acid ones naturally turn the milk sour. These bacteria are picked up by the cows standing in puddles and find the milk a favorable medium to grow in. Scald everything in hot water and then rinse the milk vessels in lime water. Try to keep the milk a little warmer or else very much cooler. These troubles in milk are nearly always outside the cow. —M. E. S.

Irrigating Grapes.

Will you please tell me how you would irrigate a Thompson seedless vineyard that is four years old. Ground not prepared in any way. Also what time or month most suitable for irrigating?

How do you prune a seedless vine. I have been pruning by leaving five or six canes as recommended by Prof. Bioletti, which don't seem just right. I have never been able to get more than four tons to the acre, more times, two tons or less. Consequently, it is hard to keep the "Wolf from the door," although I have 22 acres in vines.—S. W., Yuba City.

The description of conditions is not very full. If the water is on the land I should irrigate these vines this spring by running a deep furrow between the rows and soaking the ground well. Then as soon as pos-

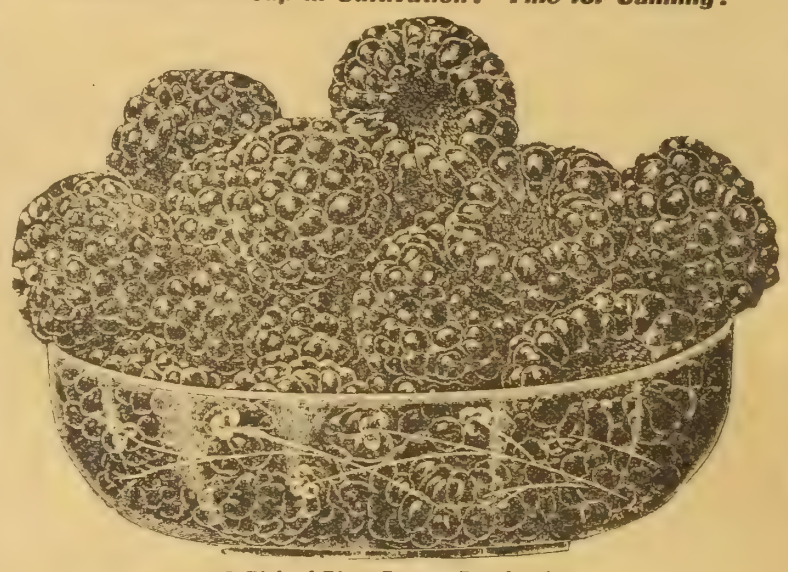
sible, throwing the earth into the furrows. If the harrow follows the plow at once in the vineyard, it will save much moisture from being lost. While this soil may be deficient in humus or in other necessary materials for vine growth, still I should not be discouraged over two tons to the acre on four year old vines. Staked vines do not reach their full maturity until six or seven years. Here we use three and four canes on Thompson Seedless. Prof Bioletti is a good authority and probably knows what your locality will stand, for Yuba soils are considered rich.

This past year the yield of grapes has not been heavy in many districts of the state. We have had in addition, smaller prices than usual. When the happy time comes that we have a law that forbids the selling of futures in food supplies then we will have only Nature to look to for the money. This year the selling short of raisins was done largely at low prices, the growers were firm in wanting a living price, so the eastern buyers were scared off and the market demoralized. We growers have enough in our struggle with Nature to do our part. We usually get left when we try to fight the combination of men who sit up at night, while we sleep, to hatch schemes of making money out of us.—M. E. S.

The Best Blackcap in Cultivation! Fine for Canning!



A Dish of Plum Farmer Raspberries

Plum Farmer Raspberry

Discovered years ago in a lot of plants received by us from Ohio, it was named in my honor by a friend of mine. You can rest assured that I would never have allowed it to be sent out under that name had I thought it anything but valuable.

It is the largest, most productive, best colored and most attractive blackcap in cultivation. The plants are models of growth, healthy and very vigorous. When not in leaf, they present a silvery bluish appearance. Plum Farmer Raspberry will succeed where other blackcaps fail. It is very early and ripens the bulk of the crop in a short time. The fruit is not jet-black, but of a grayish appearance, enormously large, sometimes measuring one inch in diameter.

The berry-growers in this locality have gone wild over it, setting it to the exclusion of all other blackcaps. It sells for highest prices, bringing as high as 12½ cents per quart right at the grower's door. It has created a furore among growers and excites the admiration of all when shown on the market.

This description is by the Plum Farmer. I wish all my friends to try this berry.

Plants Ready. Send for Catalogue.

A. Mitting, Santa Cruz, California

REX YOUR TREES WITH

LIME & SULPHUR SOLUTION

The well known REX LIME & SULPHUR SOLUTION manufactured by the California Rex Spray Company, at Benicia, is no longer an experiment. Of the thousands of customers that used it last year, we have scarcely a single report but what is in its favor.

It is the best known insecticide and fungicide; is a tonic to the tree; is prepared on scientific principles; is absolutely uniform; every barrel that is made at the factory being of just the same strength, namely, 33° solution, Baume test; is free from sediment; is ready for use in the orchard without having to be boiled; one barrel of 50 gallons makes 600 gallons of the strongest spray, and is by far cheaper, at the reduced price at which it is offered this year, than any farmer can afford to make a home-made, imperfect solution.

Ask you dealer, or address:

Olive Oil Soap.

Can you give me a formula for making an olive oil soap for toilet use? —J. H. D., San Jose.

We note the following formula, but cannot vouch for its worth: Olive oil, 100 parts, solid potassium hydroxide, 21 parts; water, 100 parts; 90 per cent alcohol, 20 parts. Boil by means of a steam bath until the oil is saponified, adding if necessary a little more spirit to assist the saponification.

Measuring Water.

When water is running over the edge of a board without pressure in a 3-foot wide headgate, how deep should it be above the edge of the board to make one foot of water? How deep to make 6 feet? How shall I prevent birds from eating fruit buds on apricot trees?—A. K.

We do not know what you mean by one foot of water. If you mean on the miner's inch basis, or if by one foot you mean 12 miner's inches, that would be one question, or if you mean one cubic foot per second it would be an entirely different matter. One and one-half cubic feet per minute means one miner's inch. Again, the measurements cannot be accurately made or even approximately made measuring up from the edge of the board. The suction of the water as it begins to pour over the edge of the board makes the water of lesser depth at that point than it would be if measured at a more accurate place, for instance a couple of feet back from the edge where the water is perfectly quiet. If the water is at a depth of say one inch in the pool, and we mean by depth down to a point equal to the top of the edge of the board over which the water flows, then your three-foot headgate would be carrying approximately 20¾ miner's inches of water. But this question is too complicated to answer in this department with any definiteness whatever and we refer you to our issue of April 16, 1908, which gives table for weir measurement, giving miner's inches, also one for cubic feet, and with illustration as to how to make weir for this measurement. Your last question, regarding preventing birds from eating fruit buds is one which is most perplexing and even impossible to answer. Use the shot gun to frighten them away and kill a few occasionally, is perhaps the most satisfactory. Pieces of tin tied to the tree to hang loose so as to flutter in the wind, will often frighten them away. The use of poisoned fruit stuck up in the trees, or of poisoned water is very objectionable, because you kill fully as many of your friends as you do your enemies.

Brine for Olives.

Please give information how to make the brine for olives. That is, what should its strength be?—W. W. S., Ventura.

This depends on whether you mean for the first or final brine. You cannot put as strong brine on the olives when the lye is first removed as you can later for the reason that the fruit is injured if submitted to too strong a brine at the very first. The usual plan is as follows: After the lye is removed, use a very weak brine, changing once in two days. Replace this brine with a stronger one composed of four ounces of salt to a gallon of water and let stand two days. Then put in brine of six ounces of salt to the gallon for seven days. They will then stand a brine of ten ounces to the gallon for a couple of weeks. The last brine should contain 14 ounces of salt to the gallon and be made of pure boiling water, set aside to cool before pouring over olives.

Various Questions.

Please give me the name of a good corn for this location. I wish it for feeding to poultry. Is it wise to set a hen twice in succession? Can I graft Drake seedlings onto prunes, apricots, and nectarines?—L. B. S., Fair Oaks.

Any good dent corn should do well in your section, but to secure the best results, you will have to select from a strain which has borne well in the same section. However, the best you can probably do the first year is to get good seed and from that crop select your own seed for next year. Many poultry men follow the plan of setting a hen twice in succession, but to do this successfully the hen must be kept free from vermin or she will become so filthy as to become of little value and will probably leave the nest. We would not advise the budding of almonds on an old orchard of prunes, nectarines, etc. As a matter of fact this can be done, but we do not think the orchard will be valuable enough to justify the time of waiting. If the trees are removed and good almonds on almond roots planted, you would probably have better results.

Bean Harvesting Implements.

Please give best implements to use in planting and harvesting lima beans, where planted in a large way? Is there an implement which will plant peanuts? How far apart are the beans in the rows?—W. H., Covina.

An implement dealer can give you this information better than this office, and we think if you will write to those advertising in the Cultivator you will get this information direct. There are certain tools however, such as the bean planter, markers, and then for harvesting, the cutter, which is something like a weed cutter, which cuts off the roots of the ripe plants just under the surface of the soil after which they are thrown in small piles. Plant rows three or four feet apart and 18 inches or two feet apart in row, according to richness of soil, farther apart in rich soil. Peanuts are usually planted by hand.

Mildew.

What is best for rose bushes? They are badly infested with mildew on leaves and the buds do not develop.—W. H. P., Santa Ana.

The simplest treatment for mildew is the scattering of flowers of sulphur over the vine when the fog is on. If the leaves are moist, it will adhere and when the rays of the sun beat upon them later, the fumes destroy the mildew, or rather prevent its spread to other roses. Roses which are susceptible to mildew, must be sulphured quite often.

Redeeming Old Vines.

When you were at the Farmers' Institute at Reedley, in your talk you gave us, you brought up the question of redeeming old vines. Now I have a vineyard that is 17 or 18 years old, and the land seems to be rich enough; but the vines don't seem to throw out wood enough to bear the fruit and therefore I have short bearing.

Now in forming the new crown, how many shoots do you tie up? Did you realize an increase in production the first year, or was it in later years?—A. E. Mc.

In regard to the longer pruning of the muscats, while any new practice

may in later years prove wrong, still after four years of this work I cannot see that it is not a distinct gain. The old vineyard on this ranch that we were about to pull out has now a greatly improved condition, and we stand good to see it bear next year, a ton of raisins to the acre.

The canes, three, four or more, on the top, or as near as they can be gotten to the top, are left two or three times as long as in the old way. Tying them together, if possible and always trying to leave the top bud one that points inward. Then all the other spurs are completely removed and the suckers must be kept off to force the growth upwards. The thing to guard against, is not to get long bare arms, but to keep the vines with plenty of side spurs on these raised up tops. After the second year the prune should only raise them a few inches each year, say six at the most. The vines will at first show a great amount of leaves, and look darker green. To my mind this shows that it is the right way to do the pruning, for it is the way the vine wishes to grow.—M. E. S.

Egyptian Corn for Silo.

Is Egyptian corn a good crop to fill silos. The corn grows well in this section, and if drilled thick, makes a growth about four feet high, and the stalks are not large and woody as when grown not so thick.

Can I cut same corn and cure it, then put through feed cutter, and feed with silage instead of hay?—Subscriber, Winters.

We do not as a rule care greatly for Egyptian corn if either Indian corn or sorghum can be as readily grown. It will make a fair silage if grown as suggested. It must be siloed before the grain hardens and then abundance of water should be used on it, to make it heat up rapidly in the silo. The bane of silage making in California is lack of moisture to make the heating up a scalding process, rather than a burning one inside the silo. (2) Yes it can be fed for roughage if the stalks are small and well cured. It will not balance up a corn ration however; alfalfa will do it either as hay or as silage. Pound for pound, alfalfa hay will balance up corn meal, while ten to twenty pounds of alfalfa hay works well against forty of corn silage. I should prefer to leave the corn at least six inches long for roughage.—M. E. S.

Pumpkins and Citrons.

Which gives the most tonnage per acre, pumpkins or citron melons? Also what is the food value of each for milch cows? Which is the easier of culture and which is harder on land?—H. J. S., Escondido.

If you grow the old-fashioned cushaw, the tonnage of available plant-food is greater per acre than ordinary pumpkins or citrons. If equal amount of pumpkins and citrons are grown to the acre, the pumpkins are the most valuable. Now can you grow more tons of pumpkins to the acre? I can grow fully as much. Then the question is one of culture. The citron seeds can be simply put into unplowed ground, or into any rough place, and will grow making a crop, while pumpkins need well tilled soil and irrigation a couple of times during the season. Neither crop can be regarded as a soil exhauster, as they do not draw deeply except on the moisture. I have not an analysis of the citrons at hand, but from memory can say that they are more valuable for succulency than for anything else in adding to the feed. The seeds contain, of course, some stored-up nutriment. From practical feeding experiences, I should say that no one around here would give you pumpkins for less than two to six dollars a ton, and citrons can usually be had for the hauling.—M. E. S.

Fifth Teat.

A 24 month's old heifer about to calve has well shaped udder, four teats properly placed, and one small teat about an inch to rear of one back one. Should this extra teat be milked? Should the treatment be same with each succeeding calf?—C. M. C., Hollister.

Do not milk the supernumerary or rudimentary teat. Nearly all great dairy cows have two extra teats on the back of the udder and often the dairy sire will have them two inches long. It is regarded as a favorable mark of productiveness in a cow.—M. E. S.

The Harris Seed Co., of San Diego, is out with a 50-page catalogue of seeds and ornamental plants, also trees, which has a fund of information including planting tables, planting calendar, etc., which makes it well worth requesting. This firm is one of the newer ones to be introduced to Cultivator readers and is catering to the wants of planters in the Southern end of the state, who demand good goods in a way that is winning increased business.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT. GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

A RHYME OF THOMAS THE DOUBTER.

When the Master had finished the story
Of the sower and the seed,
And had showed His disciples the lesson
Of rocks and wayside and weed,

Then up spoke Thomas the Doubter,
And his brow was heavy with thought—
He had seen a darker problem
In the lesson that was taught.

"Master," said Thomas the Doubter,
"When the seed sown is the Word,
I can see the meaning right plainly
Of the parable we have heard.

"But, Master, say that the sower
Were God and the seed were men,
And some of them fell by the wayside,
What were the lesson then?

"For I see men daily, my brothers,
Like the seed of which you spoke,
And among the thorns fall many,
And the thorns spring up and choke.

"And some of them, good Master,
Fall where the soil is scant,
And perish there for the absence
Of the life for which they pant.

"It is easy," said Thomas the Doubter,
"For those on good soil cast,
For they have their joy of living
And the harvest at the last.

"But those who fall by the wayside,
In thorns and on stony ground,
Are they like the seed grain scattered
By a careless hand around?"

But the Master was silent and mournful,
And His brow was furrowed with thought,
And there lay on His soul a burden
Which Thomas the Doubter had wrought.

—William Herbert Carruth.

AN IDEAL RAILROAD.

THE engine of the fast mail snorted and wheezed down the grade and whistled half a mile from Pegleg Whackem's farmhouse.

Pegleg was going to town that day, and he looked out of the window in the direction of the whistle.

Pegleg got a broom and tied a red shirt on the end of the broom handle.

"Go out and flag it, Lindy, and tell the engineer Pegleg Whackem's going to town and wants him to wait a minute."

Lindy scampered out and stood in the middle of the track, waving the red shirt from the broom handle. The whistle tooted twice, and the engine came to a stop in front of Pegleg's pump.

"Well?" said the engineer, thrusting his greasy cap and head out of the cab window.

"Pop wants to go to town," said Lindy, dragging the red shirt along the track as she went up to the engine. "He wants you to wait a minute. He ain't got his boots greased yit, and ma's ironin' him a white shirt."

"All right," said the engineer, gruffly.

"How long'll it take, do you think?"

"Oh, mebbe half an hour," said Lindy.

The engineer lay down on the grass, glad of the chance to rest.

"This is what I call railroadin'," he muttered, sinking to sleep beneath the shade of a spreading elm.

The fireman drew a cup of water at the pump. Passengers alighted from the fast mail and gathered wild flowers by the way.

An inquisitive fly awakened the engineer and he looked at his watch. Then he looked over where Pegleg Whackem was tugging at his boots.

"Hey Pegleg!" he cried. "Ain't you ever comin'? I got passengers on this train an' they want to get to the city. If you ain't ready in ten minutes more I'll go an' leave you."

"I can't git this doggoned boot on," explained Pegleg, tugging till he was red in the face. "It's got wet and shrunk, I guess."

"Well I ain't goin' to wait for your boots to dry," said the engineer, getting on his feet. "I've waited half an hour for you now. We've got fast freights on this road an' we can't be everlastin'ly knockin' them out. I'm goin' to pull out."

"Oh, you air, air you?" queried Pegleg, hotly. "Well, I guess you ain't goin' till I'm aboard, or by ginger I'll see the directors of this road in jail, sure as my name is Pegleg Whackem. You don't seem to understand that a railroad is run for the accommodation of the public. Times ain't what they used to be, when your doshdanged fast mail gave two toots and was from Peters' store to Rhodes Crossin' without stoppin'. We got some legislation, now, and the people are runnin' th' railroads—not a lot of overfed directors. So you jist wait right where you are."

"Well there ain't any law requirin' me to stay here all day if it should take you that long to grease your boots," declared the engineer, with surly disregard for the public convenience.

"Oh, there ain't, ain't there?" retorted Pegleg, rubbing the outside of his boot with a piece of soap. "Well, you jist wait till I git my copy of the revised statutes of the United States, and I'll show you whether there's any law or not." He strode into the house, with a flopping boot on one foot, returning with an immense volume, which he bore out to where the engineer was standing, and thumbed over till he came to a section encircled with a pencil mark. "There, darn you, read that!" he said. "I calculated to go to town today, and I jist looked up th' law to see what rights I had, and found 'em all set down here. It's fine and imprisonment, Mr. Engineer, if you go off an' leave me before I git this boot on, an' git on that train, an' I'll have the law on you and your whole kit an' caboodle of directors."

The engineer read the statutes slowly and with great care. Pegleg tugged at the refractory boot meantime.

"I guess you're right, Pegleg," the engineer admitted, handing back the revised statutes. "The law seems clear enough."

"You bet it's clear, an' it shows the people got some rights as well as the railroad," said Pegleg.

"I'd like to git into the city before mornin'," said the engineer. "I wish you'd hurry as much as you can, Pegleg. My passengers are gettin' nervous." "Let'em git nervous retorted Pegleg. Ain't they all got nosegays? What more do they want? Mebbe they think because I'm a farmer I ain't got no rights, but I bet I know the law better than they do. I got 26 pounds of butter to take up to the city, an' I lose two cents a pound on it if I don't git it there on this train, an' I ain't goin' to lose no such sum as that jist because the fast mail wants to make a speed record. Git a holt of that boot strap, won't you, an' see if you can't help me git this boot on."

They tugged unitedly, and the boot came on. Pegleg sighed with relief and the engineer climbed into his cab.

"Now, jist as soon as I git my white shirt on an' my butter salted on top I'll be with you," said Pegleg, returning to the house.

In five minutes he reappeared with his butter crock in his arms. Entering the coach he took two seats for himself and one for his butter, and the fast mail journed on.

Pegleg looked out of the window contentedly. "This is what I call gittin' th' railroads properly regulated," he soliloquized.

SAFETY OF THE STUPID.

"Bliggins says that he has no regrets for anything he ever said."

"Yes," answered Miss Cayenne, "that is a satisfaction enjoyed only by people who never say anything of the least importance."—Washington Star.

Th' prettiest tassels don't always hide th' biggest ears of corn.

About the House

The Household Department has a new feature this week which will remain for a few weeks at least and from the number of helpful hints for this issue, we hope it will continue many weeks.

The home keeper who writes the hints and who will have full charge of the department sends her hints under the name of "Elbepe." She is a home maker who will be pleased to get in touch with other home makers who have hints of value.

FOR the woman with "nerves," out door air, out door pleasures and out door work are the best medicines she can use—and these can be had without cost. The busy wife and mother who is cook and nurse and seamstress shakes her head doubtfully and wonders where the time is to be found for any out door employments. When the in-door work that is actually necessary is done, or partly done, the mother's strength and time are so nearly gone that the idea of one thing more is overwhelming. But the old proverb, "where there is a will there's a way," should be brought to mind and perhaps the way may be found.

One of the busiest women I ever knew—or perhaps I should say the one who by all the rules should be the busiest—told me that every day, no matter how much work there was to do if she was not sick in bed, she managed to spend some time out of doors. If there was no time for a walk or drive, if she had work that would occupy all her time, then the work was taken out of doors. Her wash tubs were carried out (she did not have the stationary tubs,) and the tiresome rubbing and rinsing and wringing were done in the fresh air under the blue sky. Her churning was usually done on the screened porch; vegetables were prepared or sewing done outside the house. It is easy to roll the sewing machine out of doors and when the weather is pleasant the sewing is not nearly so tedious if it is done with an accompaniment of birds and flowers and sunshine.

Needless to say that the children of this sensible woman I have been talking about are happy and strong and rosy cheeked, for they have been brought up on plain food and fresh air and have always had the care and companionship of a mother who has kept her "nerves" under control in spite of hard work, little money and hard cares. What woman has done another may do.

So much is said of the "left overs" in "domestic economy society" nowadays that only a new and easy way of using these troublesome factors in every household is welcomed. For, to have the reputation of providing well for your family by "setting a good table" you must give value received, either in money or time, and to use the "left overs" often takes more time than they are worth. Don't think I advocate throwing the "left overs" out of the window or setting the ragged remnants of a roast on the table for two or three meals; but I do think it is best for the average woman to practice the "simple life" in making over the remnants.

A meat pie is a wholesome and toothsome dish and one that is not long in the making. Cut the cold meat into small pieces and place in a kettle with any cold gravy you may have, a bay leaf and a little parsley, and enough water to more than cover the meat. Place on the stove and cook until the meat is very tender; add more water from time to time if necessary. Season to suit your taste, or what is more important, to suit the taste of your family. Add a little flour stirred up in a cup of cold water to thicken the water around the meat to the consistency of cream. Be sure there is plenty of this gravy for many a meat pie is spoiled because it is "too dry." Pour the meat and gravy in a baking pan and cover with a biscuit dough made with a little more shortening than for biscuits. Place in the oven and bake until brown. If you should have some cold mashed potatoes on hand beat them up with a little milk or cream, a pinch of pepper and salt, and use them instead of the biscuit dough. Make the layer about an inch thick and dot with little pieces of butter. Bake about twenty minutes or half an hour.

A dainty for the children's lunch basket is made by washing and stoning some nice dates, then rolling them in powdered sugar. Lay away to dry for a few hours and you will find that a handful of these will take the place of cake for the school lunch.

And here is a "don't." Don't allow the little girls to wear shabby Sunday finery to school. A neat print or gingham dress is much better in every way.

For people who like bananas and chocolate, a dessert is quickly made by peeling the bananas and rolling them in grated chocolate and powdered sugar. Serve with whipped cream flavored with vanilla.

IS OR IS NOT DANGEROUS.

"Railroad casualties receive such wide publicity," said an insurance man yesterday, "that there is a common belief on the part of the public that one is more liable to accidents while traveling than when living the simple life in the confines of his home.

"As a matter of cold fact, statistics show that accident insurance companies pay more losses to people who get injured in their own homes or on their own premises than they do to people hurt in railway accidents. Insurance companies pay more money to people who get hurt hanging pictures or taking stoves apart than they do to victims of head-on collisions. It sounds strange, but it's the truth."—Kansas City Journal.

WITH PERFECT EASE.

The art photographer had visited the farm. "I want to make an exhaustive study of this particular bit of landscape," he said, "and would like to have your hired man retain his present position on the fence there. Can he sit still?"

"For days at a time," replied the farmer.—Cleveland Plain Dealer.

Malthoid Roofing

Mr. W. T. Somes, Proprietor of Bimini Hot Springs Hotel, Los Angeles, Cal., U. S. A., writes as follows: "Our hotel building, a flat roofed structure covered with Malthoid Roofing, is situated quite near the large Bimini Bath Houses that burned so fiercely the night of November 15th. The wind carried the blazing shingles and red hot cinders in showers to my building, where they simmered on the Malthoid Roofing and went out, doing no damage beyond a number of small blisters raised on the surface of the roofing. We have had one rain since the fire and the roof is tight."

The Produce Markets

Los Angeles Markets

LOS ANGELES, Jan. 20, 1909.

Butter.

Butter prices have received a great boost owing to the stormy weather of the north causing a shortage of shipments. Storage is practically all cleaned up and the extremely short supply forces prices out of sight. Many dealers are quoting at 77½ but really selling at 80. The lower quotation is made for use with the northern shipper.

Produce Exchange wholesale quotations are as follows with actual selling price to the trade 2½c advance on Extras.

Creamery ex per roll	.80

Twin	.15½

Eggs and Poultry.

Buyers seem to have combined to pound down the price of eggs arbitrarily for the supply is short of the demand. Easterns are being shipped in at a loss and yet the dealers seem to control and force prices down. If it can control, prices will be found lower. It seems to be simply a case of shearing the producer.

Eggs local candled	.37@38

HE HAD A FUZZY FEELING.

In the soft twilight of a summer afternoon mother came upon Young Hopeful standing in a brown study by the greenhouse door. His hands were clasped before him and his lips were dejectedly parted, says Harper's Weekly.

"Why, what's the matter, lamb?" mother asked, bending over him.

"I'm finking, muvver."

"What about, little man?"

"Have gooseberries any legs, muvver?"

"Why, no, of course not, dearie."

A deeper shade fell athwart dearie's face as he raised his glance to her.

"Then muvver, I've swallowed a caterpillar!"

HIT AND HOME RUN.

Maud—I suppose you made a hit with that big red hat in the country.

Belle—Hit! I should say so. It struck the bull's eye the very first time I wore it.—Boston Transcript.

Hay.

During the week ending today total receipts of hay have amounted to about 2,600 tons. This amount although more than we received during the two weeks previous has moved off very readily under renewed activity after the holiday season. Prices are firm with a possible higher tendency and at the present writing we see no possibility of a lower range for some time to come. The warm rains which we are now having are doing a tremendous amount of good to the country and undoubtedly will reduce the consumption of hay in some districts by making green feed plentiful. There is only one thing which can offset this and that is a severe cold spell with heavy frost after the rain which of course would tend to kill the young grass and keep that back which has well started.

Alfalfa is perhaps in greater demand than it ever has been before owing to the fact that it can be sold cheaper than grain hay and furthermore is the best dairy fodder when green grass is not available. The supply of this article is very short in the state and considerable is now being brought from the outside.

The present range of prices we quote as follows:

Choice wheat hay	.21.00@23.00
Good wheat hay	.19.00@21.00
Other grades same	.17.00@18.00
Wheat and oat	.16.00@21.50
Tame oat	.16.00@21.00
Wild oat	.15.00@17.00
Stock hay	.12.00@14.00
Alfalfa	.14.50@18.50
Straw per bale	.50@85

Grains.

Wheat No 1	.1.67½ @1.70
Barley	.1.42½ @1.45
Corn large yellow	.1.80@1.85
Oats white	.1.67½ @1.75
Oats gray	.1.65@1.72½
Rye new crop	.1.45@1.50

Feed Stuff.

Bran per ton	.29.00@30.00
Feed cornmeal per ton	.37.00@38.00
Cracked corn per ton	.38.00@39.00
Rolled barley per ton	.27.50@30.00
Oil cake meal per ton	.38.00@39.50
Cocoanut cake per ton	.25.50@26.50
Middlings	.33.50@36.00

STRICT OBEDIENCE.

Mrs. Flint always demanded instant and unquestioning obedience from her children. One afternoon a storm came up and she sent her son John to close the trap door leading to the roof.

"But, mother—" said John.

"John I told you to shut the trap door."

"Yes but mother—"

"John, shut that trapdoor."

"All right, mother, if you say so, but—"

"John!"

John slowly climbed the stairs and shut the trapdoor. The storm howled and raged. Two hours later the family gathered for tea. When the meal was half over Aunt Mary had not appeared, and Mrs. Flint started an investigation. She did not have to ask many questions; John answered the first one.

"Please, mother, she is up on the roof."

Citrus Market

LOS ANGELES, Jan. 20, 1909.

The shipments were slowed up by the storms of last week so that the market has been strengthened and better prices prevail on oranges. Some damaged fruit has been forwarded which sold at low prices. It is nearly cleaned up and but little more will go.

Lemons are strong in tone and good returns are being made.

Shipments.

Shipments of oranges to date aggregate 2,742 cars of oranges and 963 cars of lemons.

NEW YORK, Jan. 15.—One car navels and two cars of lemons sold. Market is unchanged on navels, but very active on lemons.

Classified Liner Columns

Rates 1½ cents per word per issue. No ad. accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad. for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

FARM LANDS FOR SALE.

IMPERIAL VALLEY—DO YOU WANT to help us pioneer the **Weston Townsite** and get paid for it by getting in on the ground floor on the first 10 acre tracts, "without money and without price?"

We can offer a few 10 acre lots surrounding the Townsite at $1000.00 each, to be paid for in work on adjacent tracts or on a share basis of planting to oranges or grape fruit or to vines and deciduous trees. WESTON is situated in the centre of the famous No. 8 Water District and has more than 50,000 acres of the finest garden soil in the Valley tributary to it.

Remember the history of the townsites of Brawley, Imperial, El Centro, Holtville and Calexico and profit while you may.

If you are free to go there we can help you and you can help us. For particulars apply to IMPERIAL INVESTMENT CO., 315 H. W. Hellman Bldg., Los Angeles, Cal.

IN CENTRAL CALIFORNIA LAND can be homesteaded or taken under law requiring improvements but not residence now. Good rains, soil, water, and climate. Suitable for stock, poultry, bees, fruit, grain and garden. All first expenses about $160 for 160 acres. Convenient to work, market, railroad, some near oil wells. Some that I have located have sold for many thousand dollars. Write JOE CLARK RANCHER, Route 2, Hanford, Cal.

I make a specialty of orange and alfalfa ranches, and exchanges. 326 MAIN St., ROOM 9, Riverside, Cal., N. R. BELL.

POULTRY

Imperial County Alfalfa Fields

The Imperial Is Proving a Mecca for Stock Raisers as a Place to Drive Their Stock for Finishing Off

NEVER before has there been quite so satisfactory a state of affairs in the valley as now, as regards the quantity and value of hay and pasturage. Combined with a vast quantity of feed here, here is a scarcity on the coast which has sent prices high. Farmers are now selling baled alfalfa for $12 on board the cars in the valley, and are cleaning up the large accumulation preparatory to the cutting for the new season, which will be under way in ninety days. There is a great quantity of this baled hay being shipped, and large sums are being distributed among the farmers as a result.

There is a much smaller quantity of baled barley hay going to market, and the prices realized for this are naturally much higher.

Then there are tens of thousands of acres of barley fields being pastured, for which the farmers are receiving monthly pay from the stockmen or are fattening their own stock, all of which is bringing in large sums of money.

The dairy industry at the same time is booming, many young head coming into milk production.

The sheep men are also happy, for after a discouraging period, the price of mutton has been advancing rapidly.

With it all, there is great promise of grain with which to fatten the hogs in the summer.

And that is why Imperial valley is now getting to look much better to the people who realize what is taking place.

Money, which has been hard to get hold of for several months, is slowly but steadily becoming more plentiful, and the drift toward better things which the Standard predicted to set in January 1 is already in evidence. Another month or two will make the changed condition conspicuously apparent to everybody.—*Imperial Standard.*

The National Live Stock Association

"YOU live stock people furnish us much of our food, much of our clothing, even some of our shelter, and still more, attend to the wants of our sole." The above is from the welcome extended by Pres. Stewart of the Los Angeles Chamber of Commerce to the delegates of the American National Live Stock Association, which was called to order by Pres. J. A. Jastro at the Belasco theatre, Los Angeles, last Tuesday morning. It was a representative body of the most substantial looking class of men one often has occasion to look upon. From nearly every state and territory of the Middle West and Pacific Slope they had come to enjoy a look at the California climate and to discuss methods of advancing the great industry which they follow. More than $4,000,000,000 are invested in this one industry in the United States. Of this, California has entirely too small a proportion. For as Pres. Jastro remarked in his opening address, "Some of the fresh pork consumed in California is shipped from the middle west, as is nearly all the cured pork products."

The president called the association to order shortly after ten o'clock and the first word of welcome was extended by Mayor Harper of Los Angeles. Geo. H. Stewart, president of the Chamber of Commerce, also gave hearty welcome to the class which usually pioneers every new country. This was especially true, he said, as to California, where the livestock industry had existed even before the coming of the gold seekers. He complimented the attendance as representing a class greatly skilled in "corraling the nimble dollar and of equal skill in letting it go to roam where it will and let him catch who can. We bid you hearty welcome to our beautiful city and assure you we will keep our camp fire lighted and that the gates of our city are wide open to receive you." Response to the welcome was given for the association by H. E. Crowley, secretary of the Texas Cattle Raisers' Association. He expressed appreciation of the fact that stock growers were permitted to hear the "gates of this beautiful city swing open upon the hinges of hospitality. We accept your cordial welcome with all our hearts."

Next week's Cultivator will give more extended reference to the deliberations of the convention, which is only convening as we go to press. We are glad, however, this week to be able to give the following extracts from the annual address of President Jastro:

This is the first time the American National Live Stock Association has honored California with its convention, and being a Californian by adoption, I wish, in addition to the very cordial welcome you have received, to extend to our members, delegates and other visiting stockmen my personal welcome and thanks for their attendance. That many of you have come so long a distance is a gratifying proof of the interest you take in the work of our association, and is a tribute duly appreciated by your officers.

In earlier days California was noted for its many large cattle and sheep ranches. Indeed, the live stock industry under the Spanish rule and for many years thereafter, was one of the most important industries on the Pacific Coast. Today the old ranches, with but few exceptions, have largely disappeared, and the land formerly used for grazing is being devoted to more diversified agricultural pursuits. This transition in the far west is the same as experienced first in the Atlantic States, and then in the Mississippi Valley, and with each decade new conditions and new problems confront us. Before the railroads crossed the great Rocky Mountains and pierced the Pacific Coast, there was plenty of free range for all those pioneers who were willing to brave the hazards of the live-stock business in the unpeopled West. With the advent of adequate transportation facilities came the farmers, who settled in the fertile valleys; later on, irrigation vastly increased the land available for agriculture. The ranchman was slowly crowded into the mountains, and onto the semi-arid region, where farming cannot be conducted profitably without water and where irrigation is impracticable. With this development of the West, came also the overcrowding and overstocking of the free ranges, and their consequent depletion. The lands of Kansas and Nebraska, which were once great free ranges, have now almost entirely passed into private ownership; there is no more free grass in Texas, and it is fast disappearing in the Dakotas, Montana, and Colorado. The ranchmen of the future in those states will have to own their ranges, if they are to continue in business. There are still, however, in some of our western states and territories, such as Wyoming, Idaho, Utah, Nevada, California, Arizona, and New Mexico, great stretches of country in the mountains and on the plains, unfit for farming and impossible to irrigate. Such land has no value except for grazing, and in all human probability will always have to be used as grazing land. In many districts of this almost arid waste, it takes from fifty to a hundred acres, and even more, to support one steer, and under unwise and indiscriminate use and abuse what little value it ever possessed is fast being destroyed.

Years of experience, much of it full of misfortune, have impressed upon the stockmen the growing evils of uncontrolled and overstocked ranges. Although many solutions have been discussed by live stock associations and others interested, no definite plan satisfactory to all has yet been devised. When the question of federal control of the open range was first considered by this association, eight or ten years ago, there was a marked difference of opinion among the users of the range, but in the past few years there appears to be a steadily increasing majority who favor government control by a lease or otherwise. At our last annual meeting, the almost unanimous sentiment of our members was crystallized in a proposed bill which we desire passed by Congress. By the provisions of that bill the federal government is authorized to establish grazing districts in the semi-arid sections of the West, and to appoint officers necessary for the administration and protection of such grazing districts; to issue permits to graze live stock thereon for periods of not more than ten years, with the right to fence, giving preference to homesteaders and to present occupants of the range.

Promptly on adjournment of our convention last year, I appointed a special committee to go to Washington for the purpose of appearing before the appropriate committees in the Senate and House of Representatives in support of this land bill which had been formulated and recommended by our association.

Closely allied with this subject is the forest reserve policy of our government. I believe we are all agreed on the importance of conserving our natural resources, particularly our forests, for on them depends our water supply, as well as the future timber supply of the country. The forest service department has been freely criticized by various interests, and in the majority of cases unjustly; but the criticisms have been directed largely, if not entirely, against some of the details of their administration, and not against the general policy of forest preservation. Incapable and unreliable men have probably occasionally got into subordinate positions in the service and have abused their authority, with the result that some users of the forest reserves have seemingly been favored, while others claim not to have received their just dues. For the purpose of furnishing a convenient and accessible avenue for the settlement of such complaints or disagreements, this association, several years ago, urged the formation of local advisory boards of interested stockmen to co-operate with and advise the local representative of the forestry service in the administration of the reserves in the different districts, and I am pleased to inform you that in many districts such advisory boards have been established and have proven of great benefit in the settlement of controversies between the stockmen and the Forestry Department. The administration of the reserves has also been improved and simplified, at our suggestion, by the creation of local branch offices in charge of competent men at various large central points throughout the West. Those having business with the forest service do not now have to travel to Washington to file their complaints or to receive a proper hearing. From my observation, I believe I am safe in saying that the antagonism of the stockmen against the forest service, so evident in certain sections at the inauguration of that policy, is fast disappearing. Mr. Pinchot, the very competent head of the Forest Service, will, I am sure, welcome any suggestions you have to make as to the improvement of the service, modifications of their regulations, or changes in the fees charged.

At the time of our last meeting there was pending in Congress a bill known as the Culberson-Smith Car and Transportation Service Bill, which had been prepared by our attorney, and which was designed to prevent unreasonable delays in furnishing cars for live stock and other perishable freight, and to compel reasonable and adequate service and at a minimum speed. That bill was unanimously approved by you, and in carrying out your action, your transportation committee and officers have zealously endeavored to secure favorable action by Congress on this measure. Not longer than a couple of years ago, it was a frequent occurrence for a ranchman to drive his stock to the loading points, and then wait from two weeks to two months for cars which had been ordered in ample time, and which, in many instances had been promised for a certain date. In extreme cases the stock had to be turned back on the range because it had shrunk too badly to be shipped. It was because of this disregard of their plain duties as common carriers that our association urged the passage of the Culberson-Smith Bill. During the past year the railroad service has materially improved, and undoubtedly our efforts to secure such legislation have been a great incentive toward this improvement.

Our association has also been active in its support of the bill we had introduced in Congress, and which you approved at your last convention, prohibiting the railroads from advancing freight rates except subject to the power of the Interstate Commerce Commission to inquire into the reasonableness of the advances before they take effect, and to suspend same if deemed unreasonable. The wholesale increases in rates already made all over the country, as well as those contemplated advances so widely discussed in the newspapers, emphasize the necessity for such a law. Just now all California is protesting against a general advance in transcontinental rates.

In view of the multiple economies in the oper-

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

The Preservation of Humus

The following article is from a letter written by Gerald Geraldson of Newcastle, to James Mills of Riverside. Mr. Geraldson has written several articles for the Cultivator along this line and at the recent State Fruit Growers' Convention at Sacramento, presented his ideas most forcefully and was opposed strongly by James Mills. Mr. Geraldson now presents these views in this open letter which the Cultivator does not endorse but gives publicity to hoping it will call attention so forcibly to the need of California soil for humus, that good may be accomplished.

With all your getting you must get humus.

THERE is little need of my entering into an argument as to the necessity for humus in the soil. You have said many things that show that you appreciate this need already. Prof. Shaw, in his paper read before the recent convention at Sacramento, showed more plainly than I can the necessity for having humus in any soil that is expected to produce crops of any kind. You will remember, also, that Prof. Shaw stated that almost any soil contains plenty of plant food, in fact that the supply is almost unlimited, but that it is not available for the use of plant life except as it is made so in some way by the presence of humus. I trust that this point will not be lost sight of as I could ask for nothing better in support of my contentions.

How.

The only issue between us is as to the best means of putting humus into the soil.

Many leading authorities advise, in addition to the use of chemical fertilizers and manure, the growing of crops of legumes, said crops to be plowed under in the spring, while green and immature, as the most promising means of accomplishing this end.

I claim that this plan is not in line with Nature's methods; that it does not to any considerable extent utilize the true humus value of the plants plowed under, and that it produces a condition of fermentation and acidity in the soil that is entirely at variance with Nature's methods in such matters, which methods are the only ones that can be followed permanently. I also submit that this plan calls for expenditures for seed; for the labor of plowing the ground to be treated, and for the labor of sowing the crop thereon. Also that it subjects the ground to a large additional amount of cultivation, which, I contend, is seriously detrimental.

As a better means of putting humus into soils, and of retaining that already there, I propose the plan of cultivating alternate "middles" of an orchard on alternate years, and of cultivating farming land every second year only, instead of annually as is commonly done now, and of not pasturing such unplowed land at all until the supply of grass has become large, and then but lightly. I offer this plan for reasons which I shall now endeavor to make plain.

Nature's Way.

In the beginning this earth was simply a big rock about two thirds covered with water. The winds and the frost came and the rains descended and beat the water against the rocks, in the form of waves, and streams large and small, and broke off pieces of the rock. These pieces were further buffeted by the waters, and other action of the elements, until they were partly ground up into the small particles we call sand.

As this sand accumulated in the low places the lower forms of plant life appeared, grew to maturity, ripened, died and were beaten down by the elements, forming humus which combined with the sand and formed soil. These plants also matured seed, which, being deposited in the soil, paved the way for more vegetation in the future.

As the sand increased the vegetation increased, and, in turn, the humus and the soil increased.

As the vegetation became stronger in the low places it gradually spread to the higher slopes, held the sand there instead of allowing it to wash into the low places, and made the soil of the hill and mountain sides.

That is all. This plain, simple, logical process has made a very large percentage, if not all, of the soil in the world today. From the peat bed which is nearly all humus to the "poorest" hill side the process has been the same, varying only in degree. Humus is the vital element everywhere.

As a soil contains humus it is "rich." As it lacks humus it is "poor." And this humus was and is, always and invariably, in Nature's laboratory, made of ripened, matured vegetation; never, anywhere, of green leaves or grass.

By this process Nature is, I firmly believe, amply capable of maintaining the supply of plant food at a level so high as to support, permanently, a population many times greater than that possible under methods used today by the large majority of our agricultural population.

Alternate Middles.

An experience of six years has shown me conclusively that the system of plowing alternate "middles" in an orchard, or of plowing alternate tracts for farming, on alternate years, leads to the growth of a constantly increasing supply of vegetation, as well as to a vastly improved mechanical condition of the soil entirely independent of the matter of humus. There is no question but that earth worms, and the other forms of animal life in the soil, perform some important function; and I have demonstrated clearly that annual cultivation in some way interferes with this function, though I am not prepared to say just how.

The increased vegetation leads to increased seed, increased deposit of nitrogen, increased humus, and, through humus, to an increased availability of plant food which, in turn, leads to a still further increased supply of vegetation which makes more humus, and so on indefinitely.

There is, I believe, no limit to the possible increase of vegetation, and in turn humus, where man assists Nature by plowing the accumulated supply into the soil every second year and, at the same time, leaves alternate strips of unplowed ground, across the flow of the water, to prevent wash; and, when he gets a fine stand of grass, refrains from pasturing, except to a very limited extent.

As a soil is in a condition to promote the vigorous growth of grass, just so is it in a condition to promote the vigorous growth of trees adapted to it.

Why Not All The Orchard.

The plan of alternate middles in an orchard is necessary for several reasons.

First: It serves as a protection from fire in summer.

Second: It provides plowed ground on one side of every tree which, in the early stages of the process, retains more moisture than the worn-out, unplowed ground on the other.

Third: It prevents wash either by rain water or irrigating water.

Fourth: It provides for a better distribution than is possible otherwise, of seed.

Fifth: It insures much more animal life in the soil than is possible under annual clean cultivation.

The system does no harm of any kind that I can discover. A vigorous tree resists disease better than a weak one. If this system harbors pests it also provides shelter for their natural enemies. We have had no trouble on this account.

I have demonstrated to my entire satisfaction, and firmly believe, that if man so arranges his tillage of the soil as to allow Nature's processes to go on uninterrupted while he takes off his crops, he may take off crops indefinitely and his soil will for ever improve. The most radical thing he will have to do will be to change the kind of crop occasionally.

Bankruptcy.

On the other hand, if, in his virtuous enthusiasm, he stops Nature's processes; if he stops the grass from seeding; if he, by diligent cultivation, wears out part of his humus supply and makes conditions perfect for the washing away of the remainder; if, in other words, he destroys what humus he has and prevents Nature making any more; all the stable manure he can buy and haul and all the chemical fertilizers he can apply to his land will not prevent his ultimately reaching bankruptcy.

The reasons for this fact are; first, chemical fertilizers do not supply humus and we are told by innumerable authorities that the latent plant food in the soil can only be made available by the presence of humus, and we know that soil will not retain water except there be humus in it and that soil without water is worthless.

Second: If we all started to use chemical fertilizers as a few are now using them, there would not be nearly enough to go around and the price would become prohibitive, leading to bankruptcy.

Third: My experience, and many things that I have been told by careful observers, leads me to believe that chemical fertilizers are simply stimulants, having but a temporary effect which must be followed by a reaction sooner or later.

The supply of stable manure depends on the density of population; this, in turn, aside from temporary economic phenomena such as the present growth of cities, depends largely upon the supply of humus in the soil; therefore, the more the soil of a given community is worn out and in need of humus the less stable manure there is available to supply that need and the higher the price of it is sure to become as the demand for it becomes keener, so we do not have to follow this road far, either, before we come to bankruptcy.

Use Manure.

I do not decry the use of manure. Instead, I urge its use as far as it will go because it has great humus value combined with some chemical value, but I do say that any system of cultivation which depends solely on artificial manuring is unsound and impossible of permanence. It may be continued for a long time, but must break down eventually.

Under a civilized condition of society and correct cultivation, we should still use all of the animal manure available—and there will be plenty for actual needs under these conditions—but there will be no considerable fraction of enough if we all continue clean cultivation indefinitely.

The over-cutting of our forests; the over grazing of our pasture lands, and the over cultivation (clean annual cultivation) of our farming areas, or agricultural areas, are all precisely the same thing, and all wantonly and ruinously sacrifice the future for the sake of the present.

The injury in each case comes from removing too much of Nature's covering for the soil.

It has been demonstrated beyond argument that intelligent conservation of Nature's covering of forest areas leads to a relatively high, and constantly increasing, average annual output of merchantable timber.

Experience will show conclusively that intelligent conservation of Nature's covering of cultivated areas, namely, the allowing of the grass to grow to maturity and to seed without interference, every second year, will lead to a relatively high and constantly increasing average annual output of merchantable stock.—Ger-Ald Geraldson, Newcastle.

CITRUS GUMMING IN GENERAL.

The production of gum is the almost constant accompaniment of any injury to or interference with the functions of the citrus tree. Beside the cases of ordinary gum disease mentioned in Prof. Smith's Report the following are given in bulletin No. 200.

Orange Splitting.

In the splitting of oranges, particularly the Navel, which is so abundant and destructive some seasons, a drop of hardened gum is invariably found just at the spot where the split in the tissue occurs. Whether this accumulation of gum is a cause or effect of the splitting is difficult to determine. Indeed, in many oranges which do not split, but mature normally, drops of hardened gums can be found at the blossom end. The same is seen regularly in the saucer peach, grown commonly in Southern California.

Leaf Gumming.

The leaves of oranges and other citrus trees often show a form of gumming, but not as an indication of any particular disease. In many cases, indeed, trees with such leaves are to all appearances entirely healthy. This gumming takes the form of a brown solid deposit in spots or pustules just beneath the surface. Trees which are affected with any injurious condition are likely to show this effect in the leaves, but, as just said, it is not always an indication of any trouble.

TWIG BLIGHT.

A condition occasionally occurs on orange trees in California which may be designated by this name. This is seen as a sudden dying and withering of small terminal twigs here and there in the tree which had hitherto appeared entirely healthy and normal. The green leaves suddenly wither and remain attached to the twig, which dies back for a short distance, and with its dead leaves shows very prominently in the green foliage of the tree. Usually only small twigs are affected and the appearance is as though they had been broken and remained hanging. At the point to which the twig dies back a few drops of gum appear and harden. This trouble is by no means a serious or important one and need not be apprehended in the least where it occurs. It is quite a common occurrence, but never results seriously. No apparent cause can be seen for the death of the twigs in this manner, but the production of gum would indicate an interference with the flow of sap for some reason.—Prof. R. E. Smith in Report Diseases of Citrus Trees.

DEAD CITRUS WOOD

Is more or less prevalent in every orange and lemon grove, i. e., trees that are unprofitable. How many such have you in your orchard? Would it not pay you to put paying trees in their stead?

Your Home Grounds

Should contain at least a few trees of the better varieties of oranges and lemons. For this purpose we have some exceptionally fine trees to offer, being grown as specimens. Possibly you would like to plant a few citrus trees about your home this season. If so, will you do us the favor to correspond with us about it?

Citrus Fruits

Historically, Horticulturally, Commercially.

Our new booklet gives more valuable information about varieties, methods of planting, cultivating, pruning, picking, packing and shipping than anything of its kind ever issued. Sent anywhere for the small sum of 25 cents. Correspondence a pleasure.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

Deciduous Fruit Culture

By J. W. Mills

DEEP CULTIVATION OF VINES.

IT IS generally supposed that very deep cultivation of vines is the best method to pursue. A French author writes that young vines should be more deeply cultivated than older ones as a general proposition. The many roots that are formed when the vines are young, grow deeply, but when the vine comes into bearing, the feeding roots come nearer the surface and too deep cultivation will prove injurious. This applies to heavy soils and those above medium in this respect. On sandy soil, he concludes that deep cultivation should be always practiced.

We have learned that in the arid climate of California, it is necessary to cultivate deeper in heavy soils then in lighter ones in order to promise an efficient dust mulch. The effectiveness of a mulch is determined by the degree of fineness or depth of it. A strictly dust mulch need not be over five inches deep to give good service, but in heavy soil such a mulch cannot be made because the soil cannot be made fine, consequently it must be cultivated deeper. It is necessary to have it deep enough to prevent the rapid transmission of heat from the surface on hot days. More air will pass through a coarse mulch and it must be enough deeper than the finer mulch to offset this difference.

The practice of deep cultivation of all kinds of fruit trees has been advocated by both scientific investigators and practical growers for many years past. There will no doubt be a revision of this advocacy of deep cultivation. It is known that where practicable, orange trees do best with shallow cultivation. We know of a plum orchard that bore a record breaking crop after a season of shallow cultivation. The old writers on the subject of olive culture in its native home tell us "the olive despairs of the plow." French viticulturists now tell us that bearing vines must not be cultivated too deeply as the feeding roots come near to the surface. Why shouldn't they, for the richest soil is near the surface.—J. W. Mills.

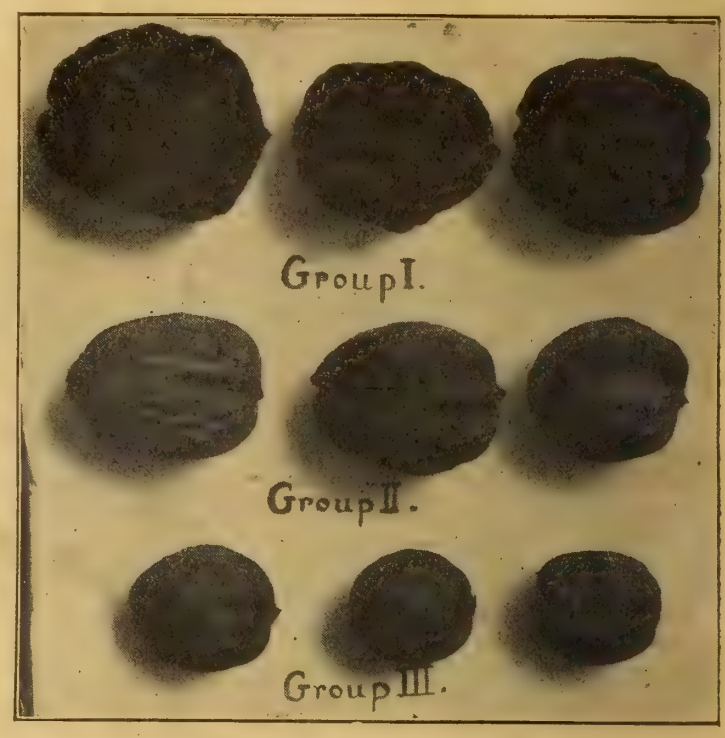
SEEDLINGS VS. THE GRAFTED WALNUT.

BY A. A. MILLS, Anaheim.

I HAVE followed with much interest the discussions in relation to walnut culture both in the press and at the farmer's institutes. Some of these discussions have been very amusing and a great deal of it very conflicting. At this season of the year the planter is very much interested as to whether to plant seedlings or grafts, and what variety of either, and if grafts,—then what root. For fifteen years now these have been the interesting questions in our immediate vicinity and more or less all over Southern California. Of late years it has spread up the coast clear to the Canadian line.

Not All Immune.

As to grafted nuts: A writer says, "Speaking of walnuts, I have several trees 10 years old, growing in deep, rich black soil, that scarcely give me a quart of nuts a year. I keep them only for scions for grafting. Franquette does the best, with the Santa Rosa second." Are we to infer from



Group I.—Typical Klondike nut, grafted. Group II.—Nuts from the same trees as group I, but modified by pollen from tree of group III. Group III.—Typical soft shell nut. All greatly reduced.

California's Largest Nursery 1500 Acres

ROEDING TRUE TREES FRESNO, CAL.

Sole Propagators Luther Burbank's New Creations

FOR twenty-five years we have been engaged in growing reliable Nursery stock. Last year we did the largest business in our history. It has always been our constant aim to produce the very best trees possible. We have made a careful study of soils and climate with the result that we have today the hardiest, best-rooted field-grown stocks on the market. We exercise the greatest possible care in handling the different varieties, and a fruit grower can buy from us with every reasonable assurance that his trees will be true to name. Being the largest growers and shippers of trees on the Pacific Coast, we naturally have very large stocks and are in a position to supply almost any demand.

We want to call particular attention to three books which are mentioned elsewhere in this advertisement and state that these books are well worth the price asked for them and will be found very interesting and valuable to those interested.

Deciduous, Citrus and Ornamental Trees, Grape Vines Palms and Roses

TREES

Experimental Farm, Plant No. 1—640 Acres
Nursery and Propagating Dept. - - No. 2—130 Acres
General Nursery, Plant No. 3—640 Acres
Citrus Nursery and Citrus Orchards 100 Acres

Every Fruit Grower

Should have a copy of the following books:

The Smyrna Fig at Home and Abroad. Price 50c.

Luther Burbank's Booklet, illustrated in colors. Price 25c.

Our general price list sent free on request.

Calimyrna Figs

Without question we stand supreme in the production of genuine Smyrna Fig trees in America. The market is wide and the supply of real Smyrna Figs very limited. The Calimyrna Fig which originated with us is the genuine Smyrna Fig of Commerce and the only Fig that is worth while planting.

California Horticulture

The Fruit Growers' Guide
By George C. Roeding

New—Just Off the Press

120 pages, profusely illustrated, beautiful lithograph cover, color plates inside. This book fully describes various kinds of citrus, deciduous and ornamental trees, roses, vines, plants, palms, etc. Gives valuable information about planting and shipping. By far the best book of its kind ever published on the Pacific Coast.

MAILED POSTPAID UPON RECEIPT OF 25 CENTS.

Fancher Creek Nurseries

GEO. C. ROEDING, Prest. and Mgr.

P. O. Box 12, Fresno, California

this that Burkank's famous Santa Rosa is doing but a little better than a pint of nuts to the tree? This experience would seem to indicate that either the grafted nut was an entire failure in that section or that the varieties were wrong. This year a man in our county reports nearly 100 pounds per tree from grafted Placentia Perfection on their own root at nine years old.

Some five or six years ago a nurseryman near Santa Paula was advertising the Placentia Perfection as free from walnut blight and only two years ago a gentleman near Whittier was advertising grafted Placentia Perfections as immune to the blight. Last spring at the farmer's institute in Whittier it was said that the Placentia Perfection would have to be discarded for varieties that were immune to the blight. For the past eight years there have been "discovered" trees and varieties immune (?) to the disease. At the present time there are many varieties advertised all over the state; each, as the only and sure immune one. The blight and observation have already removed many of these from the list of the immunes, and it is the opinion of the writer that these agencies will soon remove them all from this list. Year in and year out the grafts, so far, have proven very erratic bearers, being very tender, and therefore subject to frost, excessive dampness, heat, and blight.

The Stock.

As to the roots for grafts: A great many desire a root that will grow in soils in which the soft shell root cannot possibly thrive. In discussing this question with some planters at Santa Paula about six years ago the writer told them that such soils were not suited for walnut culture and that a man with such soil should go into some other line of ranching. I am strongly of the opinion that the soft shelled root is the best to graft or bud on, yet if people will insist on planting walnut trees on uncongenial soil, then the Northern California Black is the very best wild root.

Digging Up The Trees.

The seedling walnut, however, is the one so far that has produced the burden of wealth in the walnut sections. This, too, in the face of the facts that the selection of seed until recently, was poorly done, the soil, not always of the best and the culture, irrigation, and fertilization always at the minimum.

There have been some good seedlings planted in Central and Northern California, and when these get to be 10 years old they should give better than a "quart of nuts" to the tree. If the conditions are suitable for them they will give a good account of themselves as they have done here. Yet, we are digging up walnut orchards here, both seedlings and grafts. Last spring one man was digging out his grafted trees and selling them at $5.00 each to cut up for grafts. Another man is digging out his seedling orchard this winter, though he says that it pays him 20 per cent net on his investment. Both of these men look for better returns from Valencia orange trees, in fact, the planting of Valencias threatens to outdo the Belgian hare.

Mr. J. B. Neff here, is top grafting to one of the so-called immunes while a seedling grove next to Mr. Neff is reported to be netting 25 per cent on the investment. He, too, is hoping for something better.

A Lesson Without Words in Pruning Vines

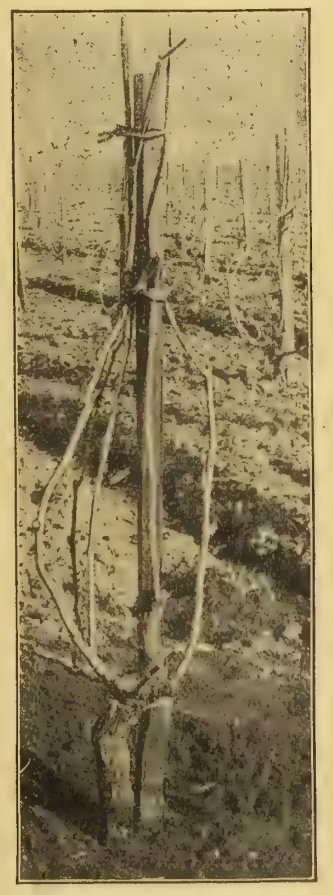
The following story of the pruning of the vine told in pictures is from the "California Horticulture: The Fruit Growers' Guide," by George C. Roeding, a book which is put on the market by Mr. Roeding at two-bits the copy and big value at that.

FIRST YEAR AFTER PLANTING.

SECOND YEAR AFTER PLANTING.

THIRD YEAR AFTER PLANTING.

TRELLISED VINEYARD SHOWING METHOD OF PRUNING.



STAKED VINE FOUR YEARS OLD.

Effect of Pollen.

The all important thing with the seedling is proper selection. Not only should the trees from which seed is taken be good regular bearers, but care must be taken to see that there are no bad trees in the immediate vicinity. The accompanying photograph gives a most striking illustration of the effects of pollen on the nuts. These nuts were grown in the back yard of Mr. Hartung of Anaheim. The Klondike is a very large nut with deep corrugations, making it exceedingly rough. The pollen from the tree of Group III smoothed down the roughness of the Klondike so that one of the nuts of Group II is nearly as smooth as the soft-shell. The size too, is considerably decreased, as can be seen. It should be noted that the nuts of Group II are not what is commonly called a "cross" or "hybrid" of the two varieties, but were growing on the same tree as Group I, and at the same time. This demonstrates that pollen from another tree will and does affect the growing nuts as well as the nuts of the future generation. When selection is properly done the seedling will give at least 95 per cent No. 1 nuts. Even where the selection has been only moderately well done the seedling has proved, and is proving to be a money getter even under primitive treatment. Where conditions have been suitable and care moderately good the yields often go more than a ton to an acre—for 17 trees, single trees going as high as 500 to 600 pounds.

Seedlings Yet to be Preferred.

To sum up I think it cannot be gainsaid that the grafts produce larger, nicer looking and finer flavored nuts; that they bear earlier; that they are erratic bearers, with a strong tendency to shy bearing, this is strongly illustrated in the case first mentioned in this article, that they are more tender than seedlings and therefore more subject to frost, excessive dampness and heat, and to the walnut disease. That the seedling has proven successful under adverse treatment; that with proper selections and care, it will prove more successful and produce at least 95 per cent No. 1 nuts; that it is harder than the graft and therefore less subject to frost, excessive dampness and heat, and to the walnut disease. Finally that the seedling is reacting to the business demands of 20 to 25 per cent net while after about 15 years the graft yet has its way to make commercially.—A. A. Mills, Anaheim, Cal.

DEMONSTRATION TRAIN.

Prof. Warren T. Clarke sends us the following information regarding Institute Work in Southern California:

The Demonstration Train which is being sent through the State by the Department of University Extension in Agriculture, of the College of Agriculture of the University of California, as a part of the Farmers' Institute effort, working in conjunction with the Southern Pacific Company, will begin its third trip on February first. The train will start from Tracy, and in the course of the present trip will visit fully forty towns in the Central San Joaquin Valley. This run will end at Bakersfield.

The next trip, which will begin in the latter part of February, will cover a part of the Southern portion of the State. The route taken will probably be as follows: Bakersfield, Lancaster, Newhall, Los Angeles, San Gabriel, Monte, Covina, San Dimas, Lordsburg, Pomona, Lemon, Chino, Ontario, Bloomington, Colton, San Bernardino, Redlands, Crafton, Highgrove, Riverside, Redlands Junction, Beaumont, Banning, Indio, Coachello, Thermal, Mecca, Brawley, Imperial, El Centro, Heber, Calexico.

As at present planned, another trip will be made later in the spring, which will cover about the following route:

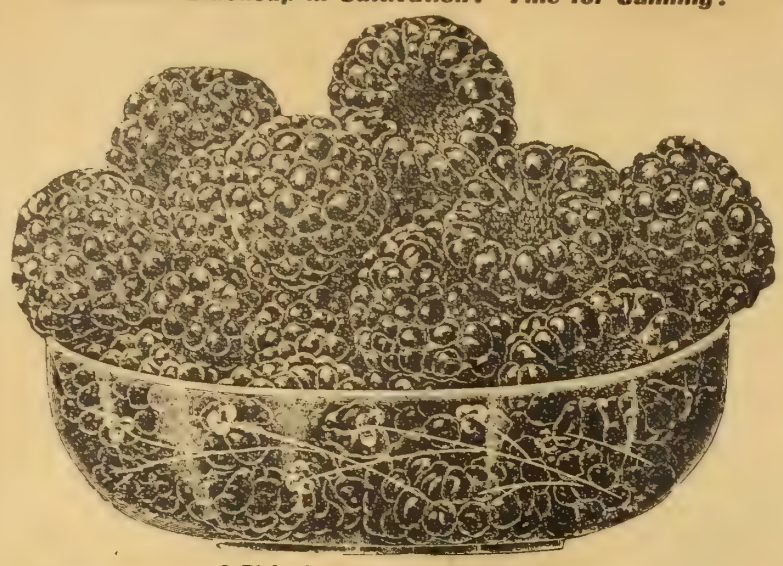
Los Angeles, Tropico, Burbank, Fernando, Lankershim, Compton, Downey, Norwalk, Buena Park, Anaheim, Santa Ana, Smeltzer, Westminster, Whittier, Pasadena, Duarte, Chatsworth, Moorpark, Somis, Camarillo, Oxnard, Montalvo, Santa Paula, Sespe, Fillmore, Piru, Ventura, Nordhoff, Carpinteria, Santa Barbara.

As a part of the make-up of the demonstration train, the College of Agriculture of the University of California has equipped two cars with exhibits which show the meaning of advanced methods in horticulture and agriculture. These exhibits are so arranged that visitors to the cars can very readily understand their meaning, and with the aid of the Experiment Station men accompanying the exhibits their practical utility is insured.

During either all or a part of the time that the train is in Southern California the following University representatives will accompany it:

President Benj. Ide Wheeler; Prof. W. T. Clarke, Supt. University Extension in Agriculture; Mr. J. B. Neff, of Anaheim, Conductor of Farmers' Institutes for Southern California; Prof. F. T. Bioletti, Viticulture; Mr. R. E. Mansell, Cover Crops and Truck Gardening; Prof. C. M. Haring, Veterinarian, Sanitary Milk Production; Prof. E. W. Major, Animal Industry, ant Prof. Ralph E. Smith, Plant Pathology. Other experts will be callet on as the occasion may demand.

The Best Blackcap in Cultivation! Fine for Canning!



A Dish of Plum Farmer Raspberries

Plum Farmer Raspberry

Discovered years ago in a lot of plants received by us from Ohio, it was named in my honor by a friend of mine. You can rest assured that I would never have allowed it to be sent out under that name had I thought it anything but valuable.

It is the largest, most productive, best colored and most attractive blackcap in cultivation. The plants are models of growth, healthy and very vigorous. When not in leaf, they present a silvery bluish appearance. Plum Farmer Raspberry will succeed where other blackcaps fail. It is very early and ripens the bulk of the crop in a short time. The fruit is not jet-black, but of a grayish appearance, enormously large, sometimes measuring one inch in diameter.

The berry-growers in this locality have gone wild over it, setting it to the exclusion of all other blackcaps. It sells for highest prices, bringing as high as 12½ cents per quart right at the grower's door. It has created a furore among growers and excites the admiration of all when shown on the market.

This description is by the Plum Farmer. I wish all my friends to try this berry.

Farmers, Take Notice

To increase your crop in quantity and quality you must fertilize. The Tom Lewis fertilizer insures big crops for everything that grows. The best and cheapest fertilizer made. It is the farmers' money maker. No trouble to use. Big crops are sure to follow. This fertilizer produces 6 to 10 pounds of grapes to the bunch. For catalogue and prices write

Thomas Lewis, 1916 10th Street, Sacramento, Cal.

Small Fruits and Vegetables

INTENSIVE VEGETABLE GARDENING.

WE READ in a paper some time ago of a clever city girl's way of raising vegetables in spite of great difficulties. Even those of us who are fortunate enough to live in the country have seen the back yard of a typical city flat—the narrow strip of damp ground, shaded almost all day by high fences and an ugly shed in the rear. This girl planted the two feet along one side fence on which the sun did shine afternoons with sweet peas and a border of red topped beets. Across the shed she coaxed a squash vine to grow, the big yellow squashes ripening on the sun baked roof.

The sun did beat down on the back steps, so here was the main garden. A window box, twice as wide as those usually made for flowers, and as long as possible was placed at the sunny porch window. In this, filled with rich soil, she planted four egg plants and sowed radishes broadcast. These were ready to eat in three weeks, and by planting seeds as the radishes were pulled out, the supply kept up all season. Around the edge went wax beans for a hanging border and up either side of the window were trained running cucumbers. Two large boxes were made for the steps in which were trellised tomato vines. In hanging baskets were small pear shaped tomatoes, bell peppers, curled parsley and cooking mint.

The "garden" was as pretty as flower boxes could have possibly been. And it was so small that after the beds were once prepared even one busy woman could care for it without making the pleasant work a burden.

I wonder if our busy farm women can not take a hint from this city garden. You know that many of our kitchen gardens are so large that with even indifferent care much must go to waste or be sold at great trouble. And, what is worse, most of them are so far from the kitchen that it does not seem worth while to walk that long distance and back again when there are only a few minutes anyway in which to pull weeds, hoe, or gather vegetables. Start a new garden this year. It is surprising how small a patch of ground will raise all the vegetables your family can eat if the ground is fertile and well cared for, and attention be given it daily instead of whenever it is not crowded out by other things.

Try intensive farming on a small scale, in a scrap of a vegetable garden near the kitchen door, planted only to the things that your experience has proved best liked by your particular family. See if you don't enjoy it and find the burden very light.

A BIG INDUSTRY.

People do not realize the size and importance of the beet sugar industry. Two-thirds of the world's sugar is beet sugar. America each year imports from Europe sugar to the value of all her receipts for exported grain

Sugar beets are, setting all extravagant statements aside, about the most profitable of all crops. Different soils require different times for planting to get best results, but generally speaking the damper the soil the earlier the beets should be planted.

A few pointers on planting and care are as follows:

First—Preparation of land: Beets require a deep soil that should be cultivated to a generous depth to allow the tap root plenty of room to grow downward. Cultivate and pulverize it thoroughly.

Second—Seed: There is often much complaint among farmers because the factory insists upon furnishing the seed, but there should be no hard feeling on this score. The factories' and the farmers' interests are identical. Each is interested in getting the seed that will produce the best results. One per cent. difference in the amount of sugar in the year's crop of beets means, in the aggregate, a big difference to the factory. Most of the seed used is imported from Germany and has a pedigree of about 75 years. Exhaustive tests have proven it absolutely the best.

Third—Planting: Use plenty of seed. You want above all things to get a good stand. Many have a tendency to use too little seed, but this is a mistake. Every plant that comes through helps to break the way for its fellows, if the ground is at all crusted. Get a good stand and thin to the proper amount. Plant seed just deep enough to reach moisture and no deeper, one or two inches being the best depth; never exceed three inches.

Fourth—Care: Cultivate often and thoroughly. Work shallow at first, later on deeper. Keep as near absolutely clear of weeds as possible. Every weed steals moisture and food from your beets and profit from you Do not spare work or pains. Germans, the best of beet raisers, say the sugar is hoed into beets.

Fifth—Harvest: Beets must be harvested before they start a second growth. After the second year's growth starts they will lose rapidly in sugar. In topping cut away the portion that grew above ground.

As soon as the crop is off plow the ground very deep. Later in the fall give it another and shallower plowing.—Dr. G. W. Shaw.

THE BOLL WEEVIL INVASION.

A few years ago there was introduced into the South a small insect from Mexico, which attacked the cotton and immediately began to cause serious damage to the crop. This insect, known as the cotton weevil, has spread rapidly through Texas and parts of adjacent states and has destroyed millions of dollars' worth of cotton. All efforts in the matter of eradicating the insect were unsuccessful. It was found by the government however, that by improved systems of farm practice, diversification of crops, the application of knowledge gained in laboratory studies and in field work, cotton could be grown despite the presence of the weevil. It was found, furthermore, that the distribution of publications was not sufficient to arouse and awaken an interest on the part of the farmer. To meet this urgent condition the department inaugurated a movement, which has spread rapidly through the South and which has had far-reaching and decidedly beneficial effects. This work has for its object the direct cooperation of the department with the individual farmers throughout the several states involved in the work. The department, in other words, has organized what it calls "farmers' cooperative demonstrations." The method, through its very simplicity, is most effective. Trained practical men in the different sections visit the farmers themselves, and induce them to adopt modifications in their method of cropping, handling the soil, planting the seed, etc.—December National Magazine.

FERRY'S SEEDS

Ferry's are best because every year the retailer gets a new supply, freshly tested and put up. You run no risk of poorly kept or remnant stocks. We take the pains; you get the results. SPRING FLOWERING BULBS.

IN the most extensive Dutch catalogues of bulbs for fall planting, fully two hundred species, and toward four thousand varieties are offered. Specialists in different lines offer a still wider choice in their lines, so that of Daffodils, alone, the enthusiast may have over five hundred named variations.

When it is remembered that in the mild climate of California along the coast-wise regions from Mendocino county south, fully four-fifths of the bulbous plants can be grown successfully out of doors, some idea of the wealth of material at our command can be had. An enthusiastic grower, with a long purse, might have a dozen new varieties for each day that intervenes between the earliest arrival and midsummer's heat.

There is a charm in bulbous plants shared by no others. Our roses, our pansies and our geraniums are with us continuously for many months. Finally we tire of them and pass

splendid specimens unnoticed. The bulbous plant, on the contrary, stores its energies for one brief glorious period of bloom and then comes to us with a charm that commands our admiration. There is nothing old or tiresome in a garden rich in bulbs, for every day brings something new and it is gone for the year before we have had time to tire of it.

One might object that we have so short a period of enjoyment for long months of waiting, but to that it may be replied that the bulb asks little and, after flowering, modestly gives way to others and sleeps a long sleep until awakened by the autumn showers to another period of root activity. Properly planted, a bulb bed gives far more return in acceptable bloom than an equal space in any other form. I am sorry to say that it is only in a few California gardens that any large variety of bulbous plants can be found or even well-selected assortments of the well known favorites, such as Daffodils, Tulips and Hyacinths. I very much doubt if in any part of the world greater success will reward equal effort, but as with our raisins, our prunes and our oranges, we have to learn the "know how" first.

In the space at my command it is out of the question to even mention the hundreds of beautiful things under this head and I will confine myself strictly to the three species just mentioned, only remarking that the same principles apply, in a large measure, to all other bulbous plants growing in our mild climate.

The Culture of Narcissus, Tulips and Hyacinths.

Early Planting.—The bulbs should be planted just as soon as they can be secured. If they are planted before the first fall rains all the better, for they will begin root growth as soon as moistened and are not in the least danger of drying out. I begin planting in August and September. The roots will grow vigorously all winter and give a correspondingly vigorous bloom. The originals of Tulips, Hyacinths and Narcissus are from regions where the climatic conditions are almost exactly the same as in California—as in Greece, Asia Minor and Spain.

While early planting is advisable and far preferable, they can also be planted later here than elsewhere with a degree of success. In the east and northern Europe there can be little root growth in midwinter, while our midwinter is as favorable as their October or April. For this reason these bulbs can be planted as late as February here. Never delay if possible to avoid it, as the bulbs lose vitality and there is as well the loss in root growth.

As To Situation and Shade.

While we have such an advantage in the matter of bulb growth through the fact that all of our winter is good growing weather for the bulb roots, we have a corresponding disadvantage in the fact that bulbs have a tendency to flower too early and with short stems and small flowers. A few weeks of mild, open weather in February, which we are more than apt to get, may bring bulbous plants into a premature flowering, which would come into their best estate toward the second week of April. This disadvantage is easily met, but it is owing to a lack of knowledge how to do that the greater part of the lack of success is to be attributed.

I well remember how some years ago I imported a very fine lot of Hyacinths and Tulips from Holland and planted them in a well-prepared bed fully exposed to the sun to the southward of my house. In February they were in full flower with stems which barely cleared the flowers from the ground and correspondingly poor flowers, for the flowers of such things grow materially in size after color shows. I was taught by this failure that they should be planted in the

(Continued on Page 111.)

DOUBLES YOUR CROP

Irrigation and Forestry

WATER-RESOURCES INVESTIGATIONS.

The United States Geological Survey has recently been instructed by the Secretary of the Interior to make an examination of the Moki and Navajo Indian reservations to determine whether or not ground waters exist there in sufficient quantities to justify development.

The region occupied by these tribes is a high desert east of the Grand Canyon of the Colorado. The Navajo are best known as the makers of Indian blankets of unique design and of particularly fine quality. Both the Navajo and Moki are pastoral tribes, herding within their reservations flocks of sheep and bands of cattle. In places where sufficient water is available small areas have been put under cultivation, Indian corn, melons, and a few vegetables being raised.

The reservations are rather rarely visited by white men, although they comprise some of the most picturesque areas in the great plateaus of the Southwest. San Juan River, one of the tributaries of the Colorado, flows along the northern boundary of the reservations in a canyon that resembles that of the Colorado, but is somewnat smaller. Just south of the Moki Reservation is the Little Colorado, which, before it joins the Colorado likewise sinks into a deep canyon whose walls are made up of vari-colored sandstone and limestone.

Mountain groups like the Carriso and the Tunitcha mountains rise above the variegated desert that forms the greater part of the reservations. These mountain masses are huge, flat-topped mesas, rimmed by cliffs that make them difficult of access. On some of them there are a few small lakes, and many of the springs that rise at the foot of the slopes leading to them are the sites of the temporary homes occupied by the more or less nomadic Indian races.

During dry years the natural sources of water supply are inadequate for the needs of the Indians and their herds, and the Indian Bureau, which has conducted reclamation investigations in the past and is now planning to increase the area under irrigation by constructing dams and canal systems, wishes also to increase the number of places within the reservations where water can be obtained for range purposes. With this end in view it has asked that this investigation be made.

EUCALYPTUS PLANTING.

To give an idea of the spread of Eucalyptus gospel we quote below from report of companies already formed in this state which will engage in Eucalyptus planting.

Foreign—California Eucalyptus Timber Company of Missouri, incorporated July 20, 1908.

Domestic—From Los Angeles—Eucalyptus Development Company, October 29, 1907; Eucalyptus Estates Company, May 7, 1908; Eucalyptus Growers' Association, May 13, 1908; Eucalyptus Land and Timber Company, July 16, 1908; Alfalfa Eucalyptus Ranch Company, August 26, 1909; California Eucalyptus Company, February 29, 1908; Eucalyptus Timber Company, July 17, 1907; Hosp Eucalyptus Forest Company, November 11, 1907; Los Angeles Eucalyptus Company, December 23, 1907; Pratt's Eucalyptus Association No. 1, May 24, 1908; Southern California Eucalyptus Growers' Association, January 2,, 1908; Western Eucalyptus Company, March 2, 1908.

By Mrs. Minna E. Sherman

RANCH DOINGS.

NOW this comes in reply to a letter asking, What are you doing in general farming at this season of the year? The barley is nearly all sown and most of it is coming up well. The sudden rains of ten days ago caught us with one day's more plowing on the heavy land. On the sandy mesa land the barley is several inches high. Now the heavier lands always present somewhat of a problem, as they must be plowed at the right time if they are to do well. The rain coming when it did caught the land, that was newly turned bermuda sod in spots and now the seeding has started to come up before it was disked. While we may try to harrow it later still I rather think it will not be practical to do so as the sods will drag the seed out of the soil. There is one thing, however, that is constantly neglected in California that pays well on the grain fields if they are free from sods and trash. This is to harrow the grain if the land crusts. The harrow can be run over grain that is several inches out of the ground, and while it will uproot a little it will increase the growth of the hay greatly. In seeding land to grain I often think if less was planted and it was put in better it would pay. The vineyardist regards grain as of secondary importance, yet the saving of growing hay rather than buying it is better than having a crop of grapes on hand that are unsalable, for where oh where will the coin come from to buy the hay for the faithful horses?

Drills.

Some should invent a cheaper drill or else invent one that would work on the nickle in the slot basis; then, if it was hired out it would collect its own rent. Wheat or barley put into well plowed land with a drill will yield in ordinary years a third more than when sown with the Stockton gang plow. The trouble with the gang plow is in the man not watching the seeder part and allowing it to choke up with trash. Then with the drill one is sure of putting in enough seed. I do not always get as much seed on the land as I would like even with the constant watching to see that enough is used. One hundred pounds to the acre is none too much on any land and some time heavy land should have twenty-five pounds more. This year a hundred pounds has been the amount we have tried to sow from the gang plows, but I doubt if we have gotten on more than eighty pounds to the acre. As the land was in oats last year and it was not long enough to harvest, owing to the long drought in the spring, this oat seed will make out the crop to the full amount we think and the two feeds together should make superior horse hay. If the season proves favorable the mesa lands will make a hay crop this year. The lower lands that are heavier soil may suffer by the seed rotting if the weather should turn cold after the heavy soaking rains of the past ten days. Farming is a matter of averages, for no matter how well we do the work the weather and soil must do the rest. How rarely is the season absolutely propitious! This year the intense heat of a few summer days burned the abundant crops of grapes while at the end of the season the drying weather was perfect. The golden days of the fall had those deep blue shadows that the French Impressionists delight in painting. Other years the grapes have ripened in their perfection of beauty, only to meet with the down pouring rain when on the trays. Yes! from the mere low standpoint of money it is better to be a banker or a pawnbroker, then when our crops go down, their crop grows quickly into a harvest of hard gained money of the people. Night and day interest piles up. While the banker sleeps his money never rests its earnings. Yet the narrowness of spirit that comes with the accumulation of wealth makes few of us wish for more than a "cot beside the rill" to end our days in peace, when the time comes to fold our hands. The educating in the Christ spirit of love, the spirit of giving, to those we love, gifts at Christmas makes it sad when the stores are not full of Christmas buyers at that season. Many a heart ached this year over unsold raisins that made rigid economy necessary in the home at Christmas time.

Hungarian Millet.

The millet sown last spring as a catch crop proved to be only waiting for at the first rain up it came, somewhat bunchy to be sure, but by growing all night as well as all day it is now in spots two feet high. There was too nearly a stand to destroy it completely, so the rest of the land was harrowed and seeded to millet with the small alfalfa hand sower. This seed is now coming up nicely and it promises to be a paying crop after all. How well the horses will eat it remains to be seen. What a useful little implement the hand sower for alfalfa is on the ranch! Where ever broad cast seeding is desired they can be depended on to do the work thoroughly for eight paces wide. Speaking of implements, I believe we have never had a better investment than the squirrel smokers; the third one is now in use and it is a money saver on the grain fields. The ranch was gone over in October and every hole smoked and stopped up. No squirrels were seen until the grain began to come up, then they moved in from the neighborhood. Now if they are allowed to stay, a few weeks will bring on a new addition and with a circle of eaten off grain around each hole the loss is considerable, while the undermining of the soil near the canal or on the creek banks becomes troublesome from caving in and washing out on the banks. Granny, the oldest saddle mare, is hitched up to an old buggy and the smoker put in with six sacks of dampened manure or old straw, a bundle of shavings to light the fire, a shovel to stop the holes and bag with some seed barley and a rake. On top of all climbs Robina and the man is the important factor in this work, for if he is not thorough the work is use-

Protection on Your Live Stock

Can Be Had Against Death From Any Cause by

Insuring

In

The California Mutual Live Stock Association

The only live stock insurance company incorporated under the laws of the State of California, with its home offices in this State.

A stockman's protective association with a guarantee deposit with the State Treasurer for protection of its policy holders.

Insures against death from disease, fire and every casualty or accident necessitating death.

Do you realize that there are $100 of values lost in stock by disease and accident where you lose $1 by fire? Why not insure where you need protection?

This is an age of mutual insurance and it is true that the cheapest and strongest companies in the United States today are composed of and managed by the policy holders, who are farmers and stockmen, as has been demonstrated in the East.

Why pay large premiums for profit to Eastern Companies, when you can co-operate with your fellow farmer and stockman and secure your insurance at actual cost?

less. Granny is indignant at the restraint of the shafts and balks at pulling, but after a few minutes repents and goes off on a hop skip lope before settling down to a trot. Every man on the ranch keeps his eyes open for squirrels and reports at the table his discoveries. After the holes are filled with smoke and stopped with earth, the spots where the little fellows have eaten the grain are raked over and resown with the barley. The barley field is kept in good shape and next year the mowers will not be running into holes. Every year the papers report cases of men thrown under the mower by horses falling from squirrel holes; one can hardly be too careful to prevent these accidents. This is one of the reasons why I prefer to smoke the squirrels out rather than to use poisoned wheat, for that leaves the hole open. Another reason is that two horses have died on the ranch from poison that must have been in wheat raked up in the hay; as this happened after the years in which a large amount of poisoned wheat was spread out it has made us very shy of putting out poison where animals can possibly secure it accidentally in their food.—M. E. Sherman.

NATIONAL LIVE STOCK ASSOCIATION.

(Continued from page 83.)

ation of railroads, greater size of trains, larger cars, and increased density of traffic, all of which would seem to warrant a reduction instead of an advance in rates, I contend that it is reasonable that before any advances are permitted they should be passed upon and receive the approval of a tribunal like the Interstate Commerce Commission. As it is now, the burden of contesting advances rests upon the shippers, many of whom are unable to defray the expenses of protracted litigation which may last five years as in the Texas live stock case.

The terminal charge case, which this association has been prosecuting for many years is still in the courts, but I am glad to inform you it has finally reached the Supreme Court of the United States once more, and a decision by that court is expected early this year.

This country produces better live stock and meat products than any other nation, and we have a surplus for shipment to these countries where meat is scarce. Although we are a nation of meat consumers, with a population of close to 90,000,000, the surplus of meat produced in the United States has been estimated to be large enough to feed either the United Kingdom or the German Empire for nearly half a year, or both for nearly three months, and the population of those countries is greater than the population of the United States. The price of our surplus largely fixes the price of our live stock at home, and the importance of increased foreign outlets cannot be overestimated.

According to the elaborate reports of the Department of Commerce and Labor, the exports of cattle from the United States during 1908 are the smallest since 1893; they average 50 per cent less than for 1906 and 1907. Our exports of nearly all classes of meat products also show a marked decrease over preceding years, only the exports of ham and lard showing no appreciable change. During the past 12 years, the total value of all our exports has almost doubled, while during the same time our exports of live animals or meat products have either remained about stationary or have shown a decrease. Our foreign trade in live animals and meat products is in a very unsatisfactory condition, and unless steps are taken to open the markets of continental Europe it will show a further decline.

Every once in a while we hear a general clamor from consumers about the high price and scarcity of meat. As a matter of fact, meat is not high in this country, and there is no scarcity. The great trouble is that too many Americans want only the choicest cuts, and as a meat animal has only a small percentage of the choice portions, necessarily they sell at a considerable premium. The less desirable cuts constitute the bulk of a carcass, and if they do not meet with a ready sale, and at a reasonable profit, then the retailer must secure proportionately more for the choice cuts. Before American consumers can expect cheaper meats, they must either learn how to economically utilize all parts of the carcass, or there must be some foreign outlet found for those portions which the American does not seem to want, and which the foreign nations are anxious to purchase. From every aspect, the importance of carefully fostering our foreign meat trade is manifest, and should receive your attention. . .

If you have followed the tariff hearings through the newspapers, you have noticed that the leather manufacturers were well represented before the Ways and Means Committee, and that they demanded free hides, claiming that the consumer would profit thereby, and insisting also that the producer received no benefit from the present duty. If the manufacturers are entitled to protection ranging from 50 per cent to 100 per cent on the products of their labor, surely the farmer and stockman is more than entitled to the very modest protection of 15 per cent on hides. From the standpoint of exact justice, the tariff on hides should not be less than the tariff on leather goods, and that would mean an advance of the tariff on hides. I have not heard that the leather people have expressed any willingness to scale down any of their protective duties, notwithstanding the fact that our exports of leather goods have increased amazingly in the past two years. There have also been numerous demands made before the Ways and Means Committee for reduction in the tariff on wool. What I have said regarding the tariff on hides applies as well to wool and live stock. In my judgment, the tariff on these articles should remain as at present.

From present indications there will be called an extra session of Congress to take up this tariff question, and there will be the most intense controversy by every interest to protect its business and to secure the most favorable terms possible. In former years the live stock industry has been a laggard in matters of this kind, and it has reaped the reward of indifference. But in future considerations of these questions, the interests of our members will be carefully looked after by your officers. Do not, however, rest secure in the belief that because your officers are at work on these matters there is nothing for you to do. I cannot too strongly impress upon you the importance of strengthening and supporting your different live stock associations. If the live stock men throughout the West

are thoroughly organized and will work together through one central organization, then we can protect our rights and secure such legislation as we are justly entitled to.

During the past few months we have had an example of the splendid efficiency of the Department of Agriculture and the Bureau of Animal Industry in its prompt and effective action in stamping out the foot and mouth disease in Eastern states.

Before closing, it may prove of interest to many of you to refer briefly to live stock conditions in California. Proportioned to its area, California cannot be classed as a great live stock State. Out of the 72,000,000 head of cattle in the United States, California possesses only about a million and a half; of the 53,000,000 sheep in this country, California has about 2,500,000; and of the 54,000,000 hogs, California has only about 500,000; from which you will observe that this state has relatively fewer hogs than any other class of live stock. In fact, our packers are compelled to ship hogs in here from Kansas and Nebraska

to supply the demand for fresh pork, and a large part of the cured pork products consumed in California are shipped in here from the East. With proper attention to that branch of live stock production, the California farmer ought to be able to supply all the hogs needed for consumption in this state, and it is a matter worthy of the earnest consideration of all interested. Undoubtedly, on some of our high-priced fruit lands, the production of live stock would not pay, but there are large tracts throughout the state where mixed farming, in connection with stock raising, would be exceedingly profitable. Those states which follow a diversified agriculture, and feed on the farm a good share of their grains and grasses, are noted for the fertility of their soil. Continual cropping of the land impoverishes the soil, but the feeding of live stock on farms enriches, and, in some cases, increases its fertility. This subject is well worthy of consideration by our small farmers.

TESTS OF HOG CHOLERA VACCINE.

The act of Congress making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1909, provides as follows:

"That the Secretary of Agriculture is authorized to purchase in the open market samples of all tuberculin, serums, antitoxins, or analogous products, of foreign or domestic manufacture, which are sold in the United States for the detection, prevention, treatment, or cure of diseases of domestic animals, to test the same and to publish the results of said tests in such a manner as he may deem best* * *."

In conformity with these provisions, samples of the following products have been tested by the Department.

1. Bruschettini's Hog Cholera Vaccine.
2. Bruschettini's Hog Cholera and Swine Plague Serum.

Both of these products are distributed by The Sorby Vaccine Company (Inc.) 163 Randolph street, Chicago, Ill.

Bruschettini's Hog Cholera Vaccine.

Two forms of labels for this product are known to be used. One reads in part, "Hog Cholera and Swine Plague Vaccine, Bruschettini." The other label is in Italian and French and reads, "Vaccino contro il colera dei suini (vaccin anticolérique des pores) Bruschettini."

In testing this product the directions for use furnished by the distributors were carefully followed. The test was made by injecting healthy pigs with Bruschettini's hog cholera vaccine and, after the lapse of ten days, placing these pigs in pens with hogs affected with hog cholera. All of the treated hogs remained well until exposed to disease in this way. After this exposure they all contracted the disease within the usual time, exhibiting typical symptoms, and all finally died, showing at autopsy typical lesions of hog cholera.

Bruschettini's Hog Cholera and Swine Plague Serum.

The labels on this product are in English and German and read "Serum Bruschettini against Hog Cholera and Swine Fever," and "Bruschettini'sche Serum gegen Schweineseuche und Schweinepest."

This product was also used in the manner directed by the distributors. Healthy pigs were injected with the serum and after twenty-four hours these were exposed to hog cholera by being placed in pens with hogs affected with that disease. All of the hogs treated with Bruschettini's serum contracted hog cholera within the usual period of time after exposure and finally died, exhibiting typical lesions of hog cholera at autopsy.

These tests indicate that neither Bruschettini's Hog Cholera Vaccine nor Bruschettini's Hog Cholera and Swine Plague Serum are reliable agents for protecting hogs from hog cholera.—James Wilson, Secretary of Agriculture.

The best thing for the young pigs is to get them out on the ground and in the sunshine. It is almost impossible to secure thrifty young pigs unless they have sunshine, exercise and a yard to run in.

The business of breeding pure bred swine is a business by itself and it should not be undertaken by anyone who cannot keep records straight and who is not willing to invest good money for improved blood.

The most conservative course is to select the breed most popular in your vicinity and improve upon the common individuals by the use of improved breeding-boars.

A large proportion of the growth obtained while the pig is less than five months of age costs but little actual money and to make the business profitable it is essential that we secure the most gain possible during the first few months of the pig's life.

LIKE A THIEF AT NIGHT THE CREAM SEPARATOR THAT CAN'T SKIM CLEAN

Dairy authorities the world over agree that the centrifugal separator is indispensable to the man who owns milk cows. And why? Simply because it saves his cream, hence his money. The more cream saved, the more money, that's sure. But unfortunately many separators do not save all the cream. And worse still the biggest of claims are made for these machines. Such separators are like a thief at night or the pickpocket who with an innocent face rubs our elbow and then robs us of our wallet. Because of inferior and out-of-date bowl construction, these separators, unknown to the users of them, daily lose a big percentage of the cream.

It is easy to be deceived into buying a "pickpocket" separator, but it is just as easy to avoid buying one if we will but take the advice of those whom we know are experienced separator judges. 99½ per cent of all expert creamerymen, butter manufacturers, and real separator authorities living today use DE LAVAL separators exclusively, for they have learned by experience that the DE LAVAL is the only separator that will save all the cream all the time under all conditions. And the reason for this fact is plain. It is found in the improved patent protected DE LAVAL "Alpha-Disc" separating bowl. It is different from any other bowl and its peculiar construction is the secret of DE LAVAL clean skimming. Ask for our illustrated catalog which explains the DE LAVAL bowl in detail as well as many other interesting features.

IMPERIAL VALLEY.

The Cultivator has often referred to the wonderful possibilities and the developments which have occurred in a short time in the Imperial valley. Some of the sections of the state may possibly have felt that undue importance has been given to this section, which but a few years ago was one of the most complete deserts on the American continent, but the attention which this section has attracted is not only due to the marvelous improvements which a short time has brought about, but to the example which it has been of a weary waste of wind-swept desert being brought to wonderful productivity by the application of water and energy and endurance of the pioneer. Five years ago the writer was driven over many parts of the valley. Water was then being carried through its canals to the more accessible parts and the pioneer was erecting little temporary habitations to shelter him from the summer's heat. We recall seeing but two or three really permanent and well-built houses at that time. After that the break in the levee in the banks of the river admitted the flood waters to Salton Sink and caused questions as to the real destiny of this valley, for which so much had been hoped. A year or two of desperate effort was required to bring this giant of the waters under control and prove to the world the worth of this section and give the assurance that permanent advance had really begun. As soon as the waters were controlled, it was seen that the wealth of the country was at command of the Imperial people if necessary to secure the permanency of her investments, and improvements and developments began in reality.

In fact this development started with such leaps and bounds along certain lines that in the case of the cantaloupe industry, it was entirely overdone, but such mistakes are characteristic of every enterprise and will in time be corrected. and we believe the Imperial will become one of the greatest sections as to stock and dairy productions and many fruits. This is particularly true of the early grapes which will, we believe, bring wealth to that section.

One thing which may be said of the Imperial section is the manner in which the newspapers represent the agricultural industry. We know of no section in the state where the papers give such attention to the farming class as they do in the Imperial valley. We believe it is wise, not only from the newspaper standpoint, but from the welfare of the entire community. They may do some politics on the side, but one great desire of the paper seems to be "Increase our own productiveness and let politics take care of itself."

THE LIVE STOCK INDUSTRY.

The president of the American National Live Stock Association in his annual address to the members who convened in Los Angeles this week said: "Out of the 72,000,000 head of cattle in the United States, California possesses only about a million and a half; of the 53,000,000 sheep in this country, California has about 2,500,000; and of the 54,000,000 hogs, California has only about 500,000; from which you will observe that this state has relatively fewer hogs than any other class of live stock. In fact, our packers are compelled to ship hogs in here from Kansas and Nebraska to supply the demand for fresh pork, and a large part of the cured pork products consumed in California are shipped in here from the East."

It may be true that California has not ideal conditions for pork production, but certainly very favorable conditions. The shortage and high price of grain is possibly a drawback but the conditions favoring alfalfa and other pasturage for hogs 12 months of the year should induce our swine raisers to extend their industry until California at least produces her own fresh meat. We appreciate fully that no industry will advance rapidly unless it is remunerative. And that if it can be shown that hog raising is profitable it will be more and more entered into until the millions of dollars we now send beyond the Rockies for pork supplies may be retained on the Pacific Coast.

But the point here raised is this: May not the proper understanding of our resources and of the requirements of the industry lead to the extension of the industry in a way which will be increasingly profitable? If corn is not to be produced here satisfactorily and its shipment from the Middle West proves too expensive there are surely other grains which can be produced here for fattening. We trust the coming of this great association to our state will awaken a new interest in live stock.

JOHN WASSON.

The death of John Wasson of the Pomona Times takes one of the characters who has had to do with the building of California for many years. He has not been actively connected with agriculture in a productive way, but his interest in it is such that he has given much energy and ability to its advancement. He was the first president of the Pomona Farmers' Club and remained at its head for many years. He came to California many years ago, living first at Oakland, at which time he was intimately acquainted with the Crockers and other builders of the first transcontinental railway. Later he served under an appointment under Gen. Grant as Surveyor-General of Arizona, and for the last twenty years has been located in the Pomona Valley, either as editor of the Chino Champion or of the Pomona Times.

To a certain extent he entered into politics and was one of the independent and sturdy ones whose integrity was never questioned for one moment.

RACE TRACK LEGISLATION.

It now appears that the anti-gambling bill which is patterned after the Hughes bill of New York, will pass at the present session of the state legislature. This is not positively assured, for the gamblers are taking every step possible to throttle this campaign for decency. It is astounding that men living in reputable communities, could go home and face their constituency after voting against such a measure which stands for preserving integrity of the state. In speaking of the curse of the race track gambling as is conducted in California, Rev. Bob Burdette recently said: "It has made liars, and defaulters, and thieves out of trustworthy young men; it has debauched young women; it has sent men to the penitentiary; it has committed murder in peaceful Monrovia and in busy Los Angeles; not one murder, but several. Often as it comes, year by year, the police department prepares for action; it is warned to special vigilance by its chiefs, the district attorney's office strengthens itself, good citizens prepare for trouble, an army of hobos, confidence men, burglars, sneak thieves, pickpockets and all the riff raff of the under world come with the 'ponies.'

"A people too cowardly to fight such an enemy as this at our own doors would need a fleet to protect us in case of war. Fleet? We'd scream for a fleet of air ships to get away with."

STATE FRUIT GROWERS CONVENTION.

We have heard of no move toward a spring session of the State Fruit Growers. The fall session is always held in the northern part of the state and if the southern part of the state has one at all it is the spring session. If no request is made of the state office for this convention it is possible that it will not be held, but we are sure that if any community is interested enough to pull strongly for this convention a spring session will be held in Southern California. It was held in Riverside last spring and it was an excellent session.

DISTRIBUTION OF FIGS BY THE DEPARTMENT.

By accident a line was left out of Mr. Swingle's announcement in our issue of January 14, concerning the distribution of new varieties of figs and caprifigs as a bonus for planting seedling figs. One cutting is given for every three seedlings planted.

In view of the lateness of the date Mr. Swingle asks that any applications for the circular be sent to Walter T. Swingle, care Plant Introduction Garden, Chico, Calif., instead of writing to Washington as suggested last week.

MAKE A GARDEN.

This is the season of the year when seed should be on hand and ready for putting in the ground for the early garden truck. Spring is so quickly on us in California that we do not always take full advantage of its earliness. Some are even now planting potatoes, although this of course only in the most protected sections. But the hardier vegetables may be planted anywhere in this state this month. This is not meant for cultural directions at this time so much as to call attention to the fact that it is time to get busy and further that the garden should be made. Don't wait for the garden patch to be plowed, but spade up at the back door a small plat.

Shop Talk

WICKSON'S CALIFORNIA FRUITS.—As has been previously advertised, the fourth edition of "California Fruits and How to Grow Them," by Prof. Wickson is now on the market and is having a ready sale. It is a fine large book and no doubt the most valuable publication ever gotten out on the subject of California fruits. Neither is it "all theory" but is based on experience and knowledge after years of study.

The Cultivator has the agency for it and is able to forward them promptly upon receipt of order. These rainy winter days should be put to good use and we know of nothing better than to have a copy of this latest authority, in the house. An hour's study of this work at every opportunity will well repay any one the small expense. The price is $3.00 postpaid to any address in the postal union.

Agricultural Notes of the Pacific Coast

Northern California

Yolo county has 65,000 acres of barley planted.

Oroville will soon have a $50,000 pre-cooling plant.

Gridley dairy men report a very prosperous season.

Middletown, Lake county, has had several cases of anthrax.

Santa Rosa has had nearly 21 inches of rainfall to date.

Grass Valley has been given the blessing of 30 inches of rain to date.

Recent large sale of hops at Santa Rosa was made on the basis of 4 7-8 cents.

Ukiah rainfall for the month of January to this date amounts to 10¾ inches.

Napa county will soon vote upon a large issue of bonds for a good roads scheme.

An immense pre-cooling plant and refrigeration plant is to be established at Oroville.

About fifty feet of snow sheds were carried away by the big snow slides in Nevada county.

Glenn county rice fields are claimed to produce double the output which rice lands of the south do.

John Lynch of Petaluma has shipped several of his dairy shorthorns to a San Diego breeder.

Healdsburg grape growers approve of the sweet wine bill introduced by Senator Perkins into Congress.

Revenue men have been confiscating butter in the San Francisco market which contained too much water.

Stockholders of the California Fruit Exchange have received a dividend of 6 per cent which was declared at the annual meeting.

Farmers at Stony Creek, Glenn county, are aroused over the appearance of Johnson grass, which is the first. An organized fight will be made on it.

The Chamber of Commerce at Red Bluff is preparing an extensive exhibit of processed fruits which will be exhibited in the Ferry Building in San Francisco.

Sonoma county co-operative poultry association reports that the output of eggs of Sonoma county is growing steadily, the last year being the largest output in its history.

Farmers near Biggs dynamited the embankment of the Southern Pacific railroad during the recent flood, so as to allow the escape of water and prevent the flooding of farms.

The Sonoma County Farmers Mutual Insurance Company have elected officers for the coming year as follows: G. W. Smith, president; Harvey Gregory, secretary; John Strong, treasurer.

Tehama county sheep owners are objecting to the inconveniences to which they are subjected by the assessors of various counties through which their sheep are driven, and are asking better regulation of the taxation scheme.

The Lake County Mutual Fire Insurance Company recently elected directors for the coming year as follows: L. Sailor, Sam Jones, J. E. Shirley, C. White, L. P. Clendinin, R. P. Burris, N. Hurlbutt, M. S. Sayre, D. A. Robinson.

Central California

The State Creamery at Davis is pasteurizing all its milk.

The State Fish and Game Commission has just released three dozen Hungarian partridges at Red Bluff.

The creamery at the State School Farm at Davis is now turning out about 1,000 pounds of butter a week.

The owners of the seeder trust have reduced the royalty half a cent on raisins in order to move the large amount of raisins still on hand.

A forest ranger station is being built on the San Benito forest reserve for which the lumber has to be hauled and packed 37 miles.

Notwithstanding the low prices of raisins and table grapes during the last season quite extensive plantings will be made in the San Joaquin valley this year.

The grape growers of Central California are now turning to the National Farmers Union as a possible way or organization and way of disposing of the raisin output.

Anderson pear orchards which were kept pruned so as to remove the pear blight a couple of years ago are now in excellent condition and showing a strong lot of fine buds promising a good crop next year.

Sacramento River Farms Company is the name of a syndicate which has recently purchased the big Fair ranch in Yolo county and is perfecting plans for an irrigation system and later subdivision of the ranch.

After an effort to hold the raisin combine together until some way of organization which will not conflict with the Cartwright Law was evolved the promoters have given the effort up and the pool has gone to pieces.

Notwithstanding the pressure brought to bear for the repeal of the Cartwright anti-trust law many producers feel that its provisions provide for them a certain protection which still make it worth preservation in spite of some of its features to which the raisin men object.

W. A. Beard of Sacramento who is connected with President Roosevelt's Country Life Commission reports that on the trip across, the Committee found that the paramount question amongst the farmers was the one of education of the young toward the farm rather than away from it.

Assemblyman J. W. Stuckenbruck of San Joaquin county announces that he will introduce a bill providing for the repeal of the game law which protects meadow larks. He maintains that the protection offered by the present law has encouraged the increase of the larks to such an extent that they are destroying grapes for Lodi vineyardists.

A new Grange, Patrons of Husbandry, has been organized at Visalia and officers elected for the first year as follows: Master, J. E. Goad; Overseer, U. S. G. Mills; Lecturer, B. C. Anderson; Steward, Herbert Swank; Assistant Steward, O. A. Givens; Treasurer, J. A. Tuttle; Chaplain, Mrs. H. A. Scott; Secretary, Mrs. B. C. Anderson; G. K., H. A. Scott; Ceres, Mrs. S. A. Teague; Pomona, Mrs. Lottie Goad; Flora, Mrs. A. M. Givens; Trustees, J. A. Leeborn, J. M. Wells, D. R. Deming.

Southern California

Saticoy is sending out liberal shipments of walnuts.

A Rochdale Company has been formed amongst the farmers of Santa Maria.

The Ojai Orange Association is building a new packing house 80 by 100 feet.

The acreage of hay about Escondido this year will be much greater than ever before.

Imperial valley farmers are looking toward the early installation of a sugar beet factory.

At the recent institute at Mound, the ladies of the Farmers' Club served luncheon at noon time.

Coachella valley is harvesting its first cabbage crop, for which the farmers are receiving $60 per ton.

The Valley Creamery Company at San Jacinto seems to be in trouble over a lawsuit over collection of debt of $2,300.

Considerable injured fruit has been shipped from some of the orange sections but this is now said to be all cleaned up.

Orange county shipped a total of 536 cars of celery up to the first of January. Since that time there has been shipped at least half as much more.

Stockmen in the Antelope valley have been much incensed at the work of the Humane Society, which has demanded the feeding of stock which has been on short pastures.

A coyote shipped by some means with a car of cattle from the Imperial section to Los Angeles escaped as soon as the car door was opened at the packing house and killed a number of sheep in the corrals before it was shot.

An item recently quoted from an Orange county paper to the effect that one rancher was grubbing up ninety acres of orange trees proves to have been unreliable information, for it is now stated that the ninety acres should have read ninety trees.

The United States Land Office at Los Angeles expects this to be the busiest year it has ever had and will probably record the biggest amount of business of any land office in the United States. This will be largely due to the Imperial Valley transactions.

The Southern Pacific has levied an attachment on the holdings of the California Development Company, which has holdings in Imperial valley, which it insists is due because of the stopping in the break in the levees of the Colorado a couple of years since. The claim is for about a million and a half.

At a recent meeting of the Tri-counties Reforestation Committee at Riverside the matter of planting eucalyptus trees on the waste lands of the upper Santa Ana River as a means of holding back the flood waters during the rainy season was discussed and it was decided to increase the planting as far as possible. President Cuttle reported that it would be possible to spread upon these lands between 7,000 and 8,000 inches of water, which would in part at least be held until the summer drouth called for its release.

The Coast

Potatoes at Tacoma, Washington, are now quoted at $24 and $28 per ton.

The four largest of the Hawaiian Islands produced last year 521,123 tons of sugar.

The United States ships to the Republic of Panama $66,000,000 of products every year.

The coldest weather brought this year to Portland, Oregon, was ten degrees above zero.

National Wool Growers Association held a valuable session at Pocatello, Idaho, last week.

Starving magpies at Hoover, Washington, have attacked swine in the field and eaten their ears off.

The best show ever, is the verdict regarding the Eastern Oregon poultry show, which closed last week.

The Oregon hop market is stronger than for many months and is now commanding 7½ cents at Portland.

Depredations of wild animals have cost the state of Oregon, it is estimated, $800,000 during the last year.

Peach trees near Walla Walla, Washington, it is feared are greatly injured by the intensely cold weather.

Cold weather at Seattle has given a great stimulus to the hay market and boosted prices, especially in alfalfa.

Twelve acres of six year old Yellow Newtons and Spitzenbergs sold last week at Medford, Oregon, for $1500 per acre.

The state of Montana will send 25 delegates to the dry farming congress which will be held in Cheyenne, February 23-25.

In some sections of Oregon, the bounties on coyotes offered by state and local organizations aggregate $25 for each scalp delivered.

Gov. Mead of Washington is appealing to the state legislature to pass a better horticultural law which will provide for county inspectors.

The snow and intensely cold weather of western Washington and Oregon has caused rapid advance in all products delivered on the markets.

Complaint is made that the orchardists of western Oregon are as a rule careless in keeping their orchards clean from pests and diseases.

Business men of Joseph, Oregon, are endeavoring to bring more wool sellers to that market, and to that end are building an immense warehouse.

The state of Washington is having trouble in the construction of its building at the Alaska-Yukon Exposition over the payment of its bills under a bond election.

The grangers of Lynn county, Oregon, are protesting against a state road which is being built more, it is claimed, in the interests of automobiles than of farmers.

It is feared that the cold weather which prevailed over the Pacific Northwest has caused the death of many salmon eggs at the Bellingham, Washington, fish hatchery.

The annual meeting of the Hawaiian Sugar Planters' Association elected the following officers for the coming year: S. M. Damon, president; W. O. Smith, secretary and treasurer.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. You ***can't*** afford to try and be successful and not get results. ***Midland Poultry Food*** will produce results. Try it and see. $1.95 per sack

PETALUMA Incubators and Brooders

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Southern California Agents for Petaluma Incubators and Brooders and Midland Poultry Food

Trap Nested White Leghorns

I trap nest every bird one year before I put them in my breeding yards, and no bird that has not made a record of 13 dozen or better per year as pullet is used. I cannot afford to breed neither can I afford to sell eggs from a hen that has not made this record as a pullet. I mate 15 hens to a well matured cockerel or yearling cock bird. My breeders have roomy yards, thus assuring strong fertility. A few choice cockerels for sale.

Eggs $1.50 per 15; $7.50 per 100; $60 per 1000.

S. E. Gregg East Adams St. Riverside, Cal.

Poultry and Live Stock Supplies

We have the MOST COMPLETE and up-to-date supply house on the Pacific Coast. We are agents for the Petaluma Incubators and Brooders, Midland Poultry Foods, etc. We have everything required for Poultry, Stock, Dogs and Birds. Send for our catalogue; it is free.

Berrar & Robertson, 103 East Santa Clara St., San Jose, Cal.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

ROUP—ITS CAUSE AND CURE.

THIS wet weather is sure to result in a crop of roup inquiries, in fact my canny Scotch neighbor has already been mixing his "dopes" ready for the first symptom, which is a wise precaution.

In the first place roup is caused by dampness, cold, and filthy houses. There are predisposing causes also, such as hereditary taints, and the unfortunate birds whose parents were once "cured" of roup are the greatest sufferers from this complaint.

The folly of breeding from such birds will now become apparent, and the hatchet should be valiantly wielded by those who hope to eradicate the disease from future flocks.

Let not a common cold be confounded with the more serious forms of disease, for a fowl, like a person, may throw off a common cold, after a slight attack, and be all right to use as a breeder.

A common cold will be known by just a catarrhal condition, causing running at the nostrils and a slight mucous affection of the eyes, and a good dose of pepper in the feed is usually sufficient, although a little aconite in the drinking water may afford quicker relief.

Some Remedies.

One drop of aconite in a teaspoon of milk is the right dose for an individual case, and a teaspoonful to each pint of the drinking water for the whole flock is sufficient.

A good old remedy for cold and preventive of roup, is common kerosene: Hold the fowl so that it cannot swallow, and fill the throat with kerosene, holding long enough so that the oil can thoroughly saturate the throat; then allow it to run out. Next wash out the nostrils, and inject a few drops of oil into each nasal passage, and the effect is often almost magical.

Many use no other remedy whatever, and dip the whole head of a badly affected bird into the kerosene, a severe cure, as it takes off the whole skin sometimes. A cold, neglected, developes into roup, bronchitis or pneumonia in a fowl, just as it does in a human being, and there are always some victims among both birds and humans that seem to be especially liable to fall a prey to these diseases. Sometimes the seemingly healthiest succumb the most quickly, and there is no telling where it will strike hardest.

To recommend any especial remedy as a sure cure, is as futile as it would be for a doctor to declare that he could cure every person who called him. All we can do is to use every means in our power to relieve, where there is hope of effecting a cure, and where a cure is considered advisable.

Last year I tried a remedy recommended by Theo Hewes in Inland Poultry Journal upon some very badly affected birds, and cured nearly every one of them, but although they afterwards became perfectly healthy, although several had lost an eye, they were only fit for the table, (the eggs, I mean), and I should not use their eggs for hatching.

This remedy is so cheap and simple it should be in every poultry keeper's cupboard ready for instant use.

A Well Kept Yard.

Procure 10 cents worth of permanganate of potash, which is a crystal of a deep purple color, requiring 16 parts of water to dissolve. Place it in a quart bottle, and fill three-fourths full of warm, not hot, water.

Shake vigorously and let stand over night to dissolve. A tablespoonful of this may be used for each gallon of drinking water for the whole flock, or better still, for each half gallon of milk or water used to wet the mash with, and for a badly affected fowl use it at the rate of one part of the above solution to three parts water, and dip the whole head under holding it there until the bird strangles, which draws it through the nasal passage. I used a crotched stick to hold the heads under with, and as every drop stains everything it touches with a dark brown, found it no pleasant task, but it cured my sick birds after their eyes were so swelled as to seem about to burst. Indeed some did burst, and it seemed much more humane to cut their heads off and put them out of their misery, but I wanted to test this cure.

Permanganate of potash is a salt of maganese, obtained from a combi-

nation of binoxide of maganese, chlorate of potash and hydrate of potash, with a little water, evaporated and ignited, and decanted, until the crystals are deposited, and was at one time supposed to be a sure cure for diabetes, but will cure roup. When a cold affects the lungs of a fowl, it droops and will not eat and the breathing can be heard at some distance. This is very difficult to cure, and is often caused from showroom colds, the changes from the hot rooms to the cold out-door air being more than a bird can stand.

Many a prize-winner have I lost from this trouble, and have tried every imaginable cure. Have kept them alive for weeks upon sweet cream and whisky poured down their unwilling throats with an oil can, only to have them die after I was sure they were cured.

The permanganate of potash should be applied twice a day, and the afflicted birds kept separate from the flock until entirely cured.

In fact, it is best never to put them back in the flock at all, lest their eggs be used for setting, and the disease continued in the offspring. Not, perhaps the active disease, but an hereditary tendency to it.

The drinking vessels must have attention while colds are prevalent, as contagion exists in the discharges from the nostrils of even slightly affected birds. Scald them out once a day, and the addition of a handful of fresh wood ashes to the water you scald with, is a good disinfectant, and very cheap. Of course none of the ashes must be left in the dish, lest crop irritation follow.

When a cold settles on a chicken's lungs, they will raise their heads and gasp for breath, and are not inclined to move, or eat, and the case is very doubtful of cure, yet the bird may recover partly, but always thereafter have a rattling in the throat, and occasional cough. To sum up the situation, it is just like this: No matter if a bird be worth $50 at the beginning, if it lives through a severe attack of roup or lung trouble, it never will be worth more than a common market fowl when cured, unless kept especially for show purposes, and the less of those saved, the better for the health of the rest shown.

Symptoms.

If you detect the wheezing at the very first, a liberal dose of kerosene poured between the wings on the back of the fowl reaches the seat of trouble as quickly as anything can, and will sometimes act promptly, while it also frees the bird from lice. But it must be used with caution, or it will blister and one application is all that should be used.

Preventives.

Prevention is better than cure always, and a generous supply of pepper in the mash just now may be the means of keeping the fowls from an epidemic of colds and roup, and have the effect of starting the laying, as well.

A tablespoon of black pepper to a gallon of mash is none too strong, or a teaspoon, scant, of cayenne, may be used instead.

We all know how hot pepper tea sometimes breaks up a cold for ourselves, and whatever is good for us is good for fowls in like conditions.

A pill of bromide of quinine may work wonders in a sick bird, as well as in a human being, and the thing to do is to use whatever remedy is at hand and use it as soon as pos-

Great Fences

AMERICAN FENCE

Made of wire that is all life and strength — wire that stretches true and tight and yields just enough under impact to give back every jolt and jam it receives.

Made of materials selected and tested in all the stages from our own mines, through our own blast furnaces and rolling and wire mills, to the finished product. Our employment of specially adapted metals is of great importance in fence wire; a wire that must be hard yet not brittle; stiff and springy yet flexible enough for splicing—best and most durable fence material on earth.

To obtain these and in addition apply a quality of galvanizing that will effectually protect against weather conditions, is a triumph of the wiremaker's art.

These are combined in the American and Ellwood fences—the product of the greatest mines, steel producing plants and wire mills in the world. And with these good facilities and the old and skilled employes back of them, we maintain the highest standard of excellence possible for human skill and ingenuity to produce.

Dealers everywhere, carrying styles adapted to every purpose. See them.

We say that is

West Coast Chick Feed

Read what others say:

SAMUEL R. KELLAM, former president of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used."

MRS. A. BASLEY, the celebrated poultry authority, says. "I want some more of your West Coast Chick Feed, for it is excellent. It is purer, cleaner and appears better balanced than other feed I had been using, and to tell the truth, I have been experimenting, feeding both together, and they always eat yours in preference."

S. M. BUTLER, Lamanda Park, California, the well-known judge and successful breeder, says: "I want to say that too much praise can't be given West Coast Chick Feed for growing chicks."

See what your neighbors say, for there is more of "West Coast" sold in Southern California than all other kinds put together. If not sold by your dealer send us $3.50 and we will send a 100 lb. sack, freight prepaid within 300 miles.

sible. But do not put $1.00 worth of expensive medicine and days of anxious work upon a 50 cent chicken, and then worry if it dies. Life is too short and time too precious for us to waste our efforts upon the impossible, so consider well whether the bird is really worth the effort, before you choose between the medicine bottle, or the hatchet.—Mrs. Frank Metcalf.

LOS ANGELES COUNTY SHOW.

The Los Angeles Poultry Association closed a very successful show last Saturday night at the Made in California Exposition in Los Angeles. The show was run on somewhat different lines than heretofore and its result is very satisfactory to the management. There have been larger exhibits in the past as to numbers, but never of finer quality. Judges Thomas and Tyler succeeded in placing the ribbons very early in the show and as a rule the awards were eminently satisfactory. The bantam show having been held so recently the little birds were not very much in evidence although there were some very fine exhibits of them. The judges say that an exhibit of finer quality birds has never been made on the coast. This was in part due to the high entrance fee, keeping down the number of entries especially of lower grade stock. Notwithstanding the storm of the entire week the attendance was very good.

The awards were as follows:

Andalusians. All awards, Mrs. Griffith.

Light Brahmas. Struthers, C, 1; H, 1; Cl, 2; Show, Cl 1; pen 1; Chandler, Cl, 3.

Partridge Cochins. Landis, C, 1, 2; H, 1, 2.

Cornish Fowl. Aikman, C, 1, 2; H, 1, 2, 3; pen, 1, 2; Cl, 1, 2, 3; P, 1, 2, 3; Williams, C, 3; Chandler, pen, 3. Cornish Fowl White. Fuiks, C, 1; H, 1; Cl, 1; P, 1, 3; pen, 1; Wagner, C, 2; P, 2.

Black Hamburgs. Rowan, all awards. Silver Hamburgs. Rowan, all awards. Houdans. Miss Grover, C, 1.

Black Langshans. Yohn, C, 1; H, 1, 2, 3; pen, 1; P, 2, 3; Hauser, Cl, 1; Rich, P, 1. Buff Langshans. Miller, all awards.

White Leghorns. Swanson & Johnson, C, 1, 3; H, 1, 2; Cl, 1, 3; P, 1, 2; pen, 1; Show, C, 2; P, 3; Gray, Cl, 2. Brown Leghorns. Nickerson, H, 1, 2; Vary, P, 1; pen, 1. Buff Leghorns. Salisbury, Cl, 1; P, 1; Flanagan, Cl, 2; P, 2. Black Minorcas. Flanagan, Cl, 1; Bonnell, Cl, 2, 3; H, 1, 2; P, 1, 3; pen, 1; Cobb, H, 3; Lovell, P, 2.

Black Orpingtons. Weller, C, 1; H, 3; Lathan, C, 2; Cl, 1, 2; P, 1, 2; pen, 1. Lloyd, C, 3; H, 2; Cl, 3; Humphreys, H, 1; pen, 2; Pearson, pen, 3. Buff Orpingtons, Sills & Son, C, 1; H, 3; Goodacre Bros., C, 2; Hayden, C, 3; Dean, H, 1, 2; pen, 1, 2, 3; Wieland, P, 1, 2, 3; Jubilee Orpingtons and White Orpingtons. Feldgate, all awards.

Barred Plymouth Rocks. F. Espe, C, 1, 2; H, 1, 2, 3; Cl, 2, 3; pen, 2; Wieland, Cl, 1; P, 1, 2, 3; pen, 1; Mitchell, pen 3. White Plymouth Rocks. Gutting, C, 1, 2; H, 1, 2, 3; Cl, 1, 2, 3; P, 1, 2, 3; pen, 1, 3; Wagner, C, 3; Humphreys, pen, 2.

Silver Polish and Golden Polish. Rowan, all awards.

Rhode Island Reds. Gunston, C, 1; Pike, C, 2; pen, 2; Thompson Co., C, 3; Cl, 2; Harrison, H, 1; P, 3; Jefferson, H, 2; P, 2; Cleveland, H, 3; P, 1; Goodacre Bros., Cl, 1; Winslow, pen, 1; Silkies. Williams, all awards. Spanish. Rowan, all awards.

Silver Wyandottes. Demmitt, Cl, 1; H, 1, 2, 3; Cornett, P, 1; Buff Wyandottes. Dillingham, C, 1, 2; H, 1, 2; Cl, 1, 2; P, 1; Tiffenbach, P, 2. Silver Penciled Wyandottes. Cornett, all awards. Partridge Wyandottes. Weisel, C, 1; H, 2; Andrews, C, 2; H, 1; Cl, 1; P, 1. White Wyandottes. Black Orpingtons, Mrs. A. E. Elridge, cock, 1; pullet, 1; hen, 1.

White Game, J. W. Sampsell, pullet, 1, 2.

Silver Duckwing Games, J. W. Sampsell, cockerel, 1; pullet, 1, 2.

Black Breasted Red Game Bantams, A. M. Brainard, cockerel, 1; pullet, 1; hen, 1; Special, Earl Pfeifer, cockerel, 2; hen, 2, 3.

Rose Comb Black Bantams, A. E. Blethen, cock, 1; hen, 1, 2; pullet, 1, 2; Special the highest scoring bird of any variety.

Buff Cochin Bantams, A. E. Blethen, cock, 2; hen, 1; Special for the best Buff Cochin Bantam. John Wisler, cock, 1; hen, 2. William Fields, cock, 2; hen, 3.

Black Cochin Bantams, A. E. Bethen, cock, 2; hen, 1, 2; pullet, 1, 2; cockerel, 1, 3; Special for the best Black Cochin Bantam. H. M. Stiles, cock, 1; hen, 3; pullet, 3; cockerel, 2.

White Cochin Bantams, H. M. Stiles, cock, 1; cockerel, 1; hen, 1; pullet, 1.

Black Tailed Japanese, F. D. Waite, cockerel, 1; Pullet, 1.

Bronze Turkeys, H. M. Stiles, 1; Gobbler, 1.

White Holland Turkeys, Charles Gould, hen, 1; Tom, 1.

Pekin Ducks, E. J. Kobbler, duck, 1; drake, 1.

Indian Runner, Gould, old drake, 1; old duck, 1; young duck, 1. Special for the best Indian Runner ducks, Clay Ave. Poultry Yards, old drake, 2; young duck, 1.

White Indian Runner Ducks, Chas. Gould, young drake, 1; young ducks, 1, 2.

White Brazilian Ducks, E. J. Kobbler, drake, 1; duck, 1. Special for the best Brazilian Duck, Mrs. A. E. Elridge, duck, 1, 2; drake, 2.

Rouen Ducks, Clay Avenue Poultry Yards, duck, 1; drake, 1.

Buff Orpington Duck, Mrs. E. M. Plaw, duck, 1; drake, 1.

Toulouse Geese, Mrs. French, old goose, 1.

White Guineas, Charles Gould, male, 1, 2; female, 1, 2; Special for the best White Guineas.

Golden, Lady Amherst, Reeves and Swinhoe Pheasants, J. G. Green, all awards.

Rhode Island Reds were the largest class in the show. White Barred Rocks were also a good class. Cats very good. The pigeon department had a nice display of fancy birds. The show was a financial success and had a good attendance which speaks for itself. Already plans are being made to hold a first-class show next year, the dates of which will soon be announced.

Germain SEED AND PLANT CO.
Dept. B LOS ANGELES, CALIFORNIA

Coulson's Special Dry Chick Food

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

Table Tools

The temper of a carving knife should be unusual—so that the knife will cut easily without being worn out on the sharpening steel. Then, again, for easy carving, the handle and the blade should be exactly balanced for nice work. These are qualities found in all Keen Kutter carving sets.

KEEN KUTTER
Table Cutlery

—from the carving set to the table knives and forks—gives ideal table service. When next buying cutlery be guided by the Keen Kutter name and trademark. It's an absolute guarantee of quality.

The Keen Kutter name and trademark also include a full line of tools, scissors and shears, razors and pocket-knives.

If not at your dealer's write us.

General Agriculture

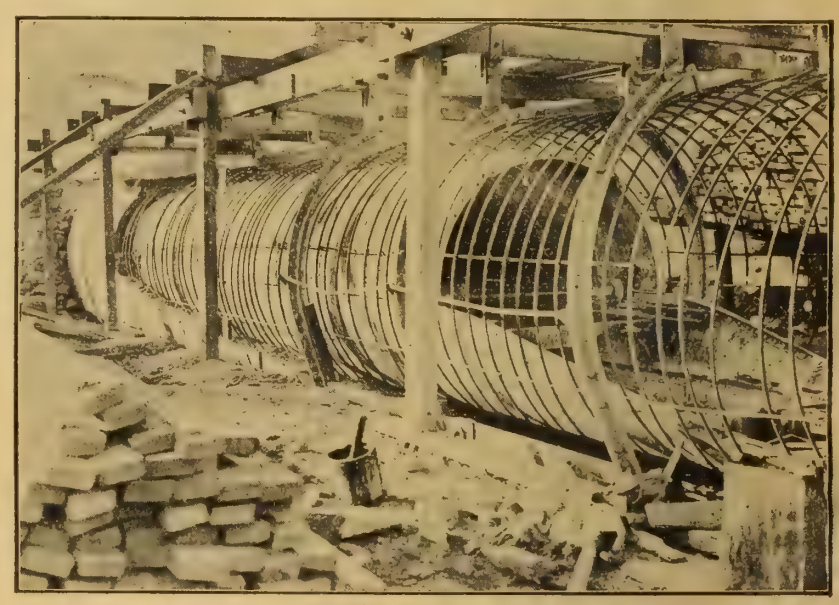
GYPSUM, ITS ADAPTATIONS AND USES.

GYPSUM is a natural compound of lime with sulphuric acid, and is known to chemists as sulphate of lime. In the early time it was called Land Plaster. Gypsum is one of the most powerful agencies known to successful and intelligent agriculture. It has been used as a fertilizer from the time of the Greeks and Romans.

There is a story that Benjamin Franklin sowed gypsum upon a clover field so that the words "This has been plastered" were written in gypsum in the middle of the field and could be read there because of the more vigorous growth of the plants as long as the crop remained. Gypsum is a natural manure.

Renders Natural Plant Food More Available.

There are three primary plant foods, potash, phosphoric acid and nitrogen.



A California Pipe Line.

To these should be added lime as materially influencing the availability of the two former. These are so-called "Critical soil elements," which constitute the valuable portion of direct fertilizers. Gypsum is mainly an indirect fertilizer. It acts by setting free plant food already in the soil, and rendering it available for plant use. Much of the natural supply of plant food in the soil is in an unavailable condition. Gypsum so acts upon this chemically as to render it immediately available.

It also has a secondary and direct action in supplying plants with both lime and sulphur, both important elements in plant economy, in case the soil is deficient in these ingredients. Gypsum encourages plant growth.

Furnishes Potash to Plants.

The direct action of gypsum previously referred to is mainly exerted upon the available potash compounds of the soil. Potash is an extremely important element in plant growth. Plants vary much in the amount of potash they consume, but it enters more or less into the composition of all, and it is found in some in large amounts. Numerous investigations show that when potash is deficient in the soil, or unavailable, plants suffer greatly, the woody portion of the plants and the fleshy parts of the fruit being dependent upon the influence of available potash. Gypsum renders potash available.

Antidote for Black Alkali.

From this standpoint alone gypsum is of the greatest agriculcultural importance. Thousands of acres of exceedingly rich soils otherwise are just sufficiently tainted with this corrosive salt, carbonate of soda, as to render crop production upon them very uncertain. Such soils should be changed to a condition of extreme productiveness by the use of gypsum in reasonable quantity. Those who are familar with alkali lands know how much more deadly to plant growth is "black alkali" than "white alkali." The active element of "black alkali" is the corrosive salt carbonate of soda, while that of "white alkali" is sulphate of soda, which is comparatively innocuous within reasonable limits to plants. Gypsum neutralizes the effect of the black alkali.

Dr. E. W. Hilgard, the great authority on soils, says:

"This salt (carbonate of soda) acts injuriously, not only in corroding the crown of growing crops, and even of trees, but also by rendering clay soils almost untillable, and by dissolving out both the vegetable matter and part of the phosphates of the soil. The use of a proper dose of gypsum on such soil obviates all these troubles. It neutralizes the corrosiveness of the soda, renders tillage easy, and restores to the proper condition the humus and the phosphates of the soil. It serves to correct similarly irrigation waters containing carbonate of soda, the continued use of which, without the corrective use of gypsum, would soon cause a fatal accumulation of 'black alkali" in the soil. The use of gypsum in irrigation ditches, or on the land itself, will effectually prevent this trouble."

The California Experiment Station was able thus to bring land which ordinarily would produce no crop, not even salt grass, to a condition in which it yielded forty bushels of wheat to the acre.

May protect Trees and Vines.

The effect of gypsum on "black alkali" land is often very striking. The brackish puddles and spots disappear, the soil soon loses its hard, puddled condition and crumbles into a loose mass, into which water soaks freely, bringing up the previously depressed spots to the general level of the land, and permitting free drainage. Gypsum may protect trees and vines already planted from the worst effects of alkali by surrounding the trunks with it or with earth mixed with it. Seeds may also be thus protected in sowing and plants in planting. On

the surface, seeds will now germinate and grow without hindrance.

Amount Required per Acre.

For the correction of alkali this will, of course, vary with the amount of carbonate of soda in the soil all the way from a few hundred pounds to several tons in the case of strong alkali spots. It is not, however, necessary to add the entire amount at once, provided sufficient be used to neutralize the portion near the surface, and enough time be allowed for the action to take place. In very wet soils this may occur within a few days, in merely damp soils in the course of several months, but usually the effect increases for several years as the salts rise from below. It should be remembered that all of the foregoing statements refer to the effect of gypsum upon "black alkali" (sal soda), and that the material does not have any beneficial action upon "white alkali" (glauber salts).

Favors Development of Bacteria in the Soil.

It thus becomes of special value in increasing the yield of legumes, as clover, alfalfa, vetches, beans, peas, etc. For ages gypsum has been used to increase the growth of red clover. But it is only a comparatively recent discovery that the growth of red clover and related plants is very dependent upon certain bacterial development about their roots. Unless conditions for this bacterial development are favorable the legumes, or pod-bearing plants, do not make satisfactory growth. The presence of these bacteria is indicated by small nodules on the roots of the plants. The activity of these bacteria is favored by a neutral or alkaline soil. Now the sulphate of potash set free in the soil by gypsum changes to carbonate of potash, and renders the soil very slightly alkaline, which favors this bacterial activity. Gypsum becomes then a specific for increasing the yield of legumes.

Increases Yield of Grapes.

L. Grandeau, the eniment French authority, reports some experiments extending over a number of years as to the value of gypsum in grape culture. These showed that applications of gypsum, both alone and in connection with barnyard manure, largely increased the yield of grapes.

Dr. James Withycombe, Director of the Oregon Experiment Station, reports yields from an acre of fall-sown vetch, which received an application of 100 pounds of gypsum April 17, and yielded 9031 pounds of hay July 11, as compared with a yield of 7394 pounds of hay from an adjoining acre, used as a check. This was an increase of 22 per cent in favor of gypsum.

Other Important Uses.

It favors the growth of many other plants, particularly cabbage, rape, turnips, hemp, flax and maize.

It is an active absorbent of ammonia gas, and thus becomes valuable in preventing loss of costly plant food in stable manure, especially that of a liquid nature, and in making composts. When mixed with decaying organic matter it acts as a preservative and prevents the escape of the valuable and costly nitrogen. For this purpose it may be scattered with a liberal hand in stables and over manure heaps.

How and When to Apply.

Gypsum is sold in a pulverized condition and is easily applied. It may be either plowed in, drilled in, placed about roots at the time of planting, or sown broadcast, depending upon the time of year and condition of the crop. While it is the more immediately effective if applied in the early fall or winter, it may be used at any season of the year without danger of loss. Its effect will not be noticeable, however, until it has been acted upon by either rains or irrigation water to distribute it well into the soil and bring it into close touch with the soil ingredients.

The quantity to use will be entirely dependent upon circumstances. There is no danger from an excess, as in the case of some materials, as it exerts no harmful effects. The usual quantity employed for use as a fertilizer is from 100 to 300 pounds per acre, while as an alkali corrective from 500 to 1000 pounds per acre may be required.

CULTURE OF FIELD CORN AND SORGHUM IN SEMI-ARID COUNTRY.

We have three varieties of field corn that do well in this semi-arid country—the King Phillip, Mexican June corn and the "Squaw" variety. The Mexican June corn, if anything, is the best, as it is a 90-day corn, and on good land it makes two ears to the stock. On fairly good land either variety will make from 30 to 50 bushels an acre, writes A. W. McGill in the Coachella Valley Submarine.

In planting, the rows should be three and one-half feet apart and about two feet in row. Have ground well irrigated before planting, and plant with planter on level surface and moist ground, or plant in a laid-off furrow, and run another furrow so as to fill up the row the corn is planted in. Then turn water down and irrigate well. As soon as it will do, run a harrow over the ground, and in a few days the corn will be up. As soon as it is three or four inches high, run through with cultivator. Keep ground fairly well irrigated and follow each irrigation with a cultivator. If planted the last week in July or the first two weeks in August, one will have well matured corn by the first of December. Cut and shock it in the field and it will make good feed for all kinds of stock. There should be a good acreage of field corn planted, as it can be grown at a time of year that other crops are not grown, and by sowing barley between rows in October one can have a cover crop to plow under in the spring for his cantaloupe crop.

Sorghum is a rank grower and produces an enormous amount of feed for all kinds of stock. It can be grown on heavy soil and really does better on such soil with some alkali in it. It is one of the best of feeds for cows in milk, as they readily eat up stalk and all, as the stalk is very sweet and contains quite an amount of sugar. It should be planted about like field corn, only drilled much closer in row. It needs lots of irrigation to produce a heavy crop, but it will grow with less irrigation, and it is known as a drought-resistant crop to some extent.

With these crops that are so well adapted to this locality, there should be a larger number of milk cows kept in the Valley, and young stock as well, as the sooner we get started with good dairy cows then will be the time that the farmers will be producing a steady income, and prosperity will follow. With a thousand milk cows in the Valley producing a regular income, and the cream being moved to the different stations, then will come good roads and a prosperous community.

IRRIGATE FROM YOUR OWN RESERVOIR

A reservoir on your own land makes you independent on the water question. You will have no trouble in filling the reservoir during the spring rains, when all the streams, little and big are flooded.

Then you will not be at the mercy of ditch owners and other water users when the dry season comes.

The few acres you will require for the reservoir will not be wasted. They will serve to make all your other lands vastly more valuable.

Raise the Water With An I. H. C. Gasoline Engine

Of course you cannot have your reservoir on your high ground. Locate it on the bottom land where it is easiest made and certain to be filled with drainage waters.

Then pump the water wherever you need it with an I. H. C. gasoline engine.

These engines, always powerful and reliable, have been found to be excellently adapted to irrigation pumping.

They are operated with little expense. They require but little attention.

They enable you to utilize the waste waters such as deep streams, sloughs and ponds upon your own land.

The farmer who has a water supply of his own, so that he may irrigate a few hours now and again, without regard to whether the water is flowing in the company ditch, is the independent farmer.

A reservoir on your own land and an I. H. C. gasoline engine to give you the water when you want it, where you want it, is the solution of the problem.

The I. H. C. gasoline engine can be used for other purposes beside pumping. It is a general purpose engine, which will be found an all around handy farm helper—to run grinder, sheller, separator, fanning mill, washing machine, churn, grindstone, etc. The I.H.C. line includes besides Famous pumping engines and jacks, the following:

Stationary engines, from 1 to 25 horse-power; Portable engines, from 2 to 20 horse-power; Skidded engines, from 2 to 8-horse-power; Tractors, 12, 15 and 20-horse-power, and Sawing and Spraying outfits.

Call on the International local agent for catalogs and all particulars in regard to these engines, or write nearest branch house.

Piru almond trees are in full bloom.

A FINE EXHIBIT.

Southern Californians have been maintaining for some weeks what is called a "Made in California Exposition." It is given over entirely to the display and demonstration of the worth of the products, principally manufactures, which are made in California. One of the most striking of these displays is that of gas engines which are propelling electric light plants, pumping plants, mining hoists and other features.

The object in mentioning this display at this time is to call the attention of any reader of the Cultivator who may be interested in investigating the merits of power to be used on the ranch. Of course there are many manufacturers of gas engines in California and the factories are generally open to inspection of the plants by intending purchasers, but the engines displayed in the Exposition have the double advantage of being located and working. This gives ample opportunity to see just how the engines act under service because they are given loads and work at this Exposition similar to those they will be obliged to carry in practical work.

EXHIBIT OF WESTERN GAS ENGINES AT THE MADE IN SOUTHERN CALIFORNIA EXPOSITION.

The engines exhibited are those manufactured by the Western Gas Engine Company of Los Angeles of which Warren H. H. Frost is the president and general manager. The exhibit is in charge of their genial representative J. B. Pridham. This concern manufactures engines, of from seven to 90 horsepower, and they are calculated to do their best work on number two California distillate, though they may be adapted to alcohol, natural gas, gasoline or naphtha.

One of the engines at the Exposition is running a complete electric lighting plant, the lights being used in working out the lighting scheme which may be observed in the photograph on this page. It was formerly found impossible to produce electric lights with gas engines without causing the continual flickering. But the exhibit at the Exposition proves conclusively that these lights produced by the Western Gas Engine are as steady as one could wish.

Part of the lights are used in lighting up the electric fountain which is a part of the display belonging to a pumping plant. This plant is run by a 7-horsepower Western and is throwing through a number 3½ horizontal centrifugal pump for so light a power a wonderful amount of water which striking against the under side of the dome is turned downward about the electric lights in such a way as to make a very pretty electrical effect.

This caused us to inquire of Mr. Pridham regarding the work of the Western Company in regard to pumping plants and he replied that while the company did not manufacture directly centrifugal or other pumps, their corps of engineers was fitted to cope with any problem and not only install electric lighting plants, pumping plants and hoists, but would be glad to give advice on any problem requiring expert engineer's opinions.

In fact this work of advice to intending users of power is one of the strong departments of the Western Gas Engine Company's big plant. No problem is too small, surely none too large, for this big concern to lend the most expert advice.

Mr. Pridham wished us to distinctly understand that every feature of the Western Gas Engine is made in California, in fact it is practically all within the boundaries of the western factory on north Main street. The big concern has its own foundry as well as machine shop so that the smallest detail of manufacture is under the supervision of the experts who have a vital interest in a perfect machine. We do not doubt the central office at the factory will be glad to show anyone the details of the manufacture of the gas engine.

GERMAIN SEED CATALOGUE.

The Germain Seed and Plant Company of Los Angeles has just issued a new illustrated catalogue of 116 pages, which contains much valuable information to planters.

The book has a lithograph cover, the front of which shows a street lined with large Eucalyptus trees on either side with the wording, "Eucalyptus the road to wealth." The back cover shows a picture of Germain's Oregon Evergreen Sweet Corn. Vegetable and flower seeds and plants are fully priced, illustrated and described. A complete catalogue of poultry and stock foods, as well as supplies of all kinds, including garden tools. Also general information about the care of the garden, when and how to plant. There is also a complete list of the best Agricultural Horticultural and Poultry books.

This catalogue is sent free to any one mentioning this paper.

The California Development Association is making efforts to bring the irrigation men and the miners together so that there may be no conflict of interests.

Bees and Their Care

GRADING RULES FOR COMB HONEY.

The following rules adopted by Eastern and Colorado apiarists are given in Gleanings in Bee Culture and are perhaps of interest to California bee men.

Eastern Grading Rules.

Fancy.—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

Grading Rules of the Colorado State Bee Keepers.

No. 1.White.—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separatored honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separatored honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparatored honey to average not less than 23 pounds net per case of 24 sections.

No. 1 Light Amber.—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separatored honey to average 21 pounds net per case of 24 sections; no section in this grade to weight less than 13½ ounces.

Cases of half-separatored honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparatored honey to average not less than 23 pounds net per crate of 24 sections.

No 2.—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separatored honey to average not less than 19 pounds net.

Cases of half-separatored honey to average not less than 20 pounds net per case of 24 sections.

Cases of unseparatored honey to average not less than 21 pounds net per case of 24 sections.

MANAGEMENT OF BEES.

Bees may be managed for either the production of comb honey or for extracted honey. While they will produce more of the latter to the hive than comb honey, yet the higher price that comb honey will bring makes the income from each amount the same.

The difference in the management is that for comb honey little section boxes are placed in shallow "supers," or upper stories, in which the bees build about one pound of honey per box, while for extracted honey the upper story is deeper and contains, instead of section boxes, large frames, in which the bees build their combs and store their product, the honey being extracted by the keeper and the combs used over again.

In comb honey the bees have to build new combs each time, but for extracted honey the same combs are used over and over again, and thus the bees have time to give more extracted honey per hive than comb honey.

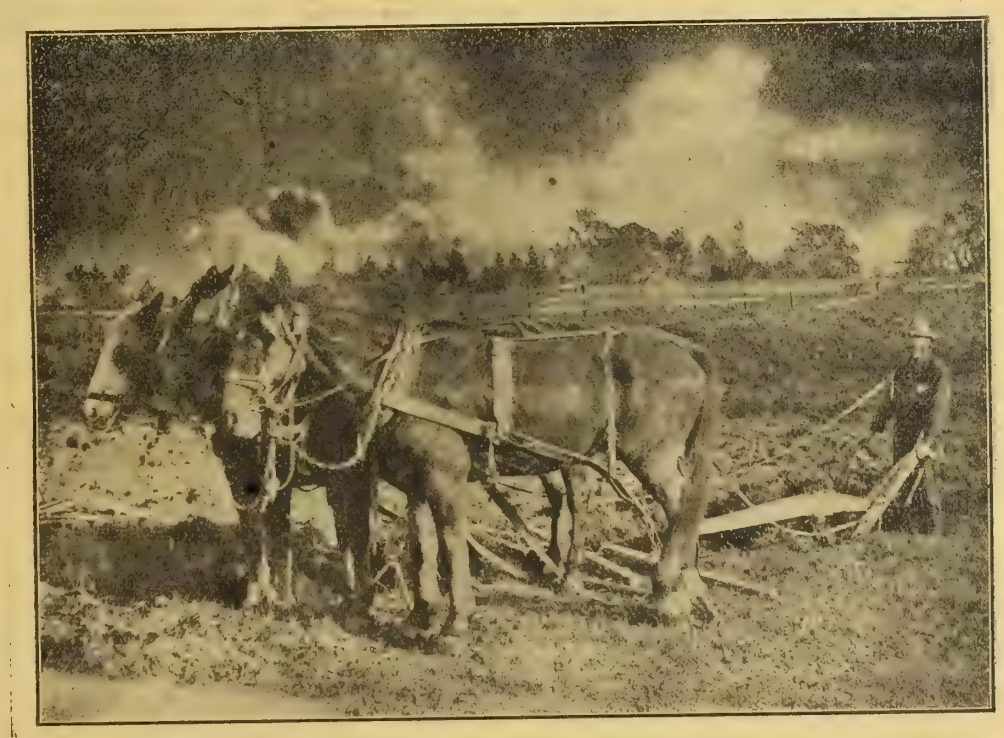
The method of extracting the honey is very simple, the first thing being to throw a puff of smoke from the smoker into the entrance of the hive, and in about two minutes the bees will be subdued. The next thing to do is to raise the top of the hive and lift out the frames one by one, and after gently brushing the bees off, to carry the frames to some room in which the extractor is kept. All is now ready for extracting. Taking a knife especially made for the purpose, the beekeeper shaves off the cappings, or tops of the cells, and, replacing two combs in the extractor, he gently whirls them around for about five minutes, and at the end of that time every drop of honey has been extracted and the combs are returned to the bees, who fill them again in a few days.

One advantage of running bees for extracted honey over that of comb honey is that it does not lead to swarming; but as this perfectly natural process comes from lack of space in which to store the honey that is at times coming very freely from the fields, it can be controlled by giving more boxes to be filled, and by clipping the wings of the queen, in which case every swarm can be hived.—Globe-Democrat.

THE BANTAM SHOW.

The second one of the three poultry shows held in Los Angeles this year was the Fifth Annual Exhibition of the Southwestern Pigeon and Bantam Club, recently held in Chutes Park. There were 236 bantams displayed and 484 of 23 varieties of pigeons. Judge F. H. Thomas of Los Angeles placed the ribbons on the bants and R. D. Moore of Oakland, on the pigeons. The number of bantams exhibited was large for a bantam show and the quality was as a rule exceedingly high. Amongst the winners are the following: Golden Sebrights, M. E. Dillingham, Bud Stevens; Silver Sebrights, F. H. Thomas, W. J. Bodger; Buff Cochins, M. E. Dillingham, W. H. Cornet; Black Cochins, W. J. Blackman, W. J. Bodger; White Cochins, W. J. Blackman, W. J. Bodger; Partridge Cochins, M. E. Dillingham; Light Brahmas, M. E. Dillingham; Black Tailed Japanese, M. W. Smith, M. E. Dillingham, H. W. Richardson, and Ida A. Richardson; Black Breasted Red Games, W. J. Bodger, M. E. Dillingham; Birchen Games, W. J. Bodger; Old English Games, W. J. Bodger; Red Pyle Games; W. J. Bodger; Brown Red Games, W. J. Bodger; White Games, John Brenton, W. Morehouse; Golden Duckwing, W. Morehouse; White Booted, W. J. Bodger; White Crested Polish, R. D. Peck; Rose Comb Brown Leghorns, Barlow & Vogel; S. C. Brown Leghorns, Barlow & Vogel.

Best display of Cochin bantams, W. J. Blackman. Best display of Black Tailed Japanese M. M. Smith. Best display of all kinds bantams, W. J. Bodger. Best display of Game bantams, W. J. Bodger.



SAN JOAQUIN COUNTY PLOWING.

CHICKEN CHAT.

Possibly Roup or Pip.

In your answer in the January 7th issue to the lady who lost three fowls that acted as if they had swallowed something, I wish to say that I think it must be a disease, because I lost a rooster last week in exactly the same way. There is no barley, no lime, or no alkali land here.—Mrs. H. K., Watsonville.

Chickens with diphtheritic roup sometimes act as if they had swallowed something that wouldn't go down, as the membrane forming in the air passages slowly chokes them to death, and is a very serious disease indeed.

But in this disease the birds refuse to eat, while the birds referred to in the article above tried to eat up to the very last, but were unable to do so. There is a disease called "pip" which is a horny growth upon the end of the tongue, preventing the bird from eating, but that would surely have been noticed in examining the fowl, I should think. This must be treated by dropping powdered chlorate of potash upon the tongue, and removing the growth with the pen-knife.

* * *

Picking Feet.

Will you kindly tell me what to do when young chickens pick each other's feet?—Subscriber, Douglas, Arizona.

The young cannibals haven't enough to do to keep them out of mischief. Put chaff in their runs so their feet will sink down out of sight and make them scratch for their living.

Also put a head of lettuce, an apple or an onion where they may pick at it and be sure to place a small piece of fresh meat where they can work on that. A piece of trapped gopher, where one is sure no poison has been placed or some of the pieces of game too much shot up for the table will be a grand feast for the chicks.

A pinch of salt in their feed will also help them to better behavior, as it is some element in their food which is lacking, in part, which causes this provoking habit.

"SAVE THE WATER."

J. B. Neff writes that the article last week on Save the Water which was a series of disconnected notes quoted from a paper reporting account of an institute is in no sense a correct account of his statements at that institute. A careful reading shows many inaccuracies which Mr. Neff never uttered.

One of the principal subjects which was discussed at the National Wool Growers Association was that of the erection of immense warehouses to store the output of wool until a satisfactory price could be secured for it, meantime issuing storage certificates upon which wool producers could secure money advances.

Make the Lame Horse as Sound as Ever—Keep Every Horse in Prime Condition With

Tuttle's Elixir

No other remedy has such a record for curing spavin lameness, splints, curbs, shoe boils, thrush, swellings, cuts, etc., as well as colic, founder and distemper.

All over the country, in over 100,000 stables, Tuttle's Elixir has proved itself the dependable and safe remedy for all the ailments mentioned, and has won and proved its title of "The Old Reliable Standby."

Tuttle's Elixir has put many injured, limping, blemished horses in condition after veterinarians and other preparations have failed.

Makes Best Leg and Body Wash

as proved by the fact that it is the only lotion used by owners of most famous race horses. Send for the proofs. And let us tell you **why** Tuttle's succeeds where others have failed. Write us today for our

Valuable Veterinary Book, FREE

It is called "Veterinary Experience" and it **IS** the life-long experience of Dr. Tuttle, boiled down into a clear and concise guide for every horse owner in all emergencies. It is free to you, but you'll find it worth dollars. No matter how much you know about horses, you'll find some new and valuable pointers in this book. It deals also with: Tuttle's Family Elixir—White Star Liniment—American Condition Powders—American Worm Powders—and Hoof Ointment.

Ask your dealer for Tuttle's Remedies. If not there, we'll send by express. **Don't experiment.** Get Tuttle's and be **sure.** Write us now for the Free Book.

REX YOUR TREES WITH

LIME & SULPHUR SOLUTION

The well known REX LIME & SULPHUR SOLUTION manufactured by the California Rex Spray Company, at Benicia, is no longer an experiment. Of the thousands of customers that used it last year, we have scarcely a single report but what is in its favor.

It is the best known insecticide and fungicide; is a tonic to the tree; is prepared on scientific principles; is absolutely uniform; every barrel that is made at the factory being of just the same strength, namely, 33% solution, Baume test; is free from sediment; is ready for use in the orchard without having to be boiled; one barrel of 50 gallons makes 600 gallons of the strongest spray, and is by far cheaper, at the reduced price at which it is offered this year, than any farmer can afford to make a home-made, imperfect solution.

Ask you dealer, or address:

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sick Pigs.

I have been losing my three months old pigs at the rate of about one of two every three or four days. They grow weak, although they have an abundance of feed.

We have three brood sows that seem to be similarly attacked. They are thin from suckling pigs, and I think have been bred lately. One of them has been growing thinner for over two weeks and lies around and sleeps all of the time unless driven out to feed.

When I drive her out, she will cough at first and there will be a sort of slobber come from her mouth. She will then go right to eating and if she were not so thin and humped up, one would not know there was anything the matter with her.—L. G. C.

Probably catarrhal pneumonia which sometimes runs into consumption. I should certainly kill one or two of the worst cases and examine them carefully to find the affected portions of their bodies. Catarrhal pneumonia is not rapidly fatal nor is it necessarily fatal, for if the weather turns warm and sunny, many cases recover without treatment. Start in by cleaning out and spraying the walls, sides and floors of a pen, using anyone of the coal tar preparations or using carbolic acid in weak solutions. As soon as the pen is dry, put in plenty of bedding, then pick out the pigs that are near to one size and put them into the house. Go through the yard separating the pigs into lots, taking, of course, the sickest ones in one lot. Feed them on soft food as scalded alfalfa meal, bran—two parts to one part of oil meal, adding milk if you have it sweet. Any sort of roots may be added if stewed well until tender enough to be eaten without effort. The following mixture helps them out. Ten pounds of charcoal, ten pounds of ashes, five pounds of powdered sulphur, five pounds of bluestone, five pounds of ground bone, one pound of salt, one pound of red pepper and one of anise seeds; the last two articles are not necessary, but sometimes make the pigs eat it better. Put this mixture into shallow boxes where they can eat of it freely. If the bran, alfalfa meal, oil cake or vegetables cause looseness of the bowels, a small quantity of rolled barley fed dry will often correct the trouble. As soon as they recover condition, they can be gradually put on to their regular feed again. They must be kept dry and warm to recover. The smaller weaker pigs must not be allowed to sleep with the larger ones as they are too weak to escape being smothered. Spray the houses and floors frequently enough to keep them pure. Plenty of clean bedding and no drafts in the houses may be secured by having drop curtains over the doors made from barley sacks, nailing them at the top of the openings and putting across the bottom a pole. The pole will hold the corners out and prevent them from being blown around. The pigs learn to push under the poles, to enter the houses.—M. E. S.

Oregon Questions.

I live in the mountains of Southern Oregon, close to Rogue River. Much of the soil here is heavy. Some is gravel and covered with chaparral—called chaparral land; while much is adobe. Over much of the land is a growth of fir, pine, oak, etc., here open, here thick.

The winters are mild—we have had to date 12 degrees of frost. Our winters are rainy and occasionally snow falls, in the valleys, but plenty of snow on mountains near by. We have here about 30 to 35 inches of rain, being very dry from June till September.

There is little grass growing on the ranges, having been eaten off by a surplus of cattle, hogs and sheep. There is no sod, as in the prairie states, except where sheep or goats have congregated largely, tramping down and heavily fertilizing the top soil. I wish to introduce some good pasture grass on my own fenced land. No attempt seems to have been tried so far, to my knowledge. Will burr clover thrive here as in California? I am told alfalfa will dry out except where irrigated. Will the Persian alfalfa thrive here without irrigation. Can you recommend any other grass or forage plant? Cattle live here through the winter, largely by browsing—hogs fatten on acorns when there is a crop, but is not a sure crop.

Do you think chestnuts will thrive here; also pecans? Where can seed suitable for planting be obtained? I do not know if they are sulphured where grown and if that would injure growth, or I could buy them in the open market. Will figs thrive in this climate? Will eucalyptus grow where it is as cold as it is here?

Our roads are impassable and your paper is most welcome. We enjoy sitting by the fire and reading, these long evenings.—M. H. Cusick, Trail, Oregon.

It would seem that the only thing this querist can do, is to try some experiments, just as every pioneer must do. He does not say how much lower the mercury has been known to drop, but judging from the reports in today's paper it must be considerably lower than 12 degrees below freezing now. I see no reason why alfalfa would not produce one crop annually; for while it will not grow and make a crop through three or four months drought, it will live and come up smiling when the rainy season returns. Your correspondent probably means Turkestan or Arabian alfalfa when he speaks of Persian. Imported seed is claimed to be hardier than American product and is quoted at 28 cents per pound by mail. Would it not be possible to get water for irrigation at a small cost? Rye, if sown in the fall, would produce an immense quantity of forage in the spring months, I should think. If the situation were mine, I would secure a pound each of several varieties of grass seed and sow them as an experiment. And I would arrange to turn some of that mountain water on the land and see what effect it would have. Burr clover would doubtless thrive through the early part of the season and ripen its seed when the dry season came. But it would also sprout and start to grow on the advent of rain in the fall, but would not survive the winter. Give it a trial.—Q. A. L

I question if the pecan would thrive there. The chestnut might. It is entirely hardy. You can get one year seedlings very cheaply. It is a question with figs, but it wouldn't cost much to try. The eucalyptus is not hardy enough to endure the climate. —Q. A. L.

See That Patent spring ?

It means much to the fruit grower who realizes the need for effective spraying, but deplores the ordinary pump with its exhausting labor, its unsatisfactory spray and its continual clogging and bother. This spring is found only in

Bean Magic Spray Pumps

It would be found in others, but the Bean Patents prevent it. This spring divides the work, permitting the operator to do half the work at each stroke of the handle. And he works against but half the pressure indicated on the gauge. It saves just one-third the labor. Two sizes of Bean Magic pumps; both have Bean patent spring, non-clogging ball valves, and other exclusive features.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

Tomatoes.

Please give names of best tomatoes put up by canneries. How is tomato seed bed prepared?—Subscriber, San Jose.

No variety seems so popular with the canners as the Stone. Be sure you secure a good strain of seed.

As the canner rarely begins on tomatoes before Sept. 1st, there is no necessity for starting early, and hotbeds will not be needed to start the seeds. No way that I ever tried is so cheap and successful as to grow them in flats—such as are now used so largely in growing encalyptus trees. Sow the seeds in rows in the flats and when they send out the third leaf, prick off into similar flats, putting them about two inches apart each way. When they are three to four inches high they can be taken to the field and set into permanent quarters without loss, by cutting out the ordinary curved trowel carried by the seedsman.

This method if properly handled will give strong, stocky, well-rooted plants that will transplant without check or loss, and at a very low cost. In our own work we frequently use pots instead of flats, but then we have them always on hand by the thousand, and structures for the care of the plants.—Q. A. L.

Residue from Acetylene Gas.

Is the residue from acetylene gas plant of any value as a spray for apple and pear trees, the object being to combat woolly aphis and fungus? Should it be added to salt and sulphur, and how much should be added to such residue?—E. C., Orange.

We have never heard of this being tried and inquiry amongst farmers shows that the opinion prevails that while it might be worth an experiment the results would be very questionable. Excepting where a farmer is of experimental turn and has means to carry it to a conclusion, and also can afford to put up with failure on the part of such a spray it is best to stick to the well tested formulae. Most of these have been tested under all kinds of conditions by the State Experiment Stations.

From California Horticulture by Roeding.

a square of soil with each plant. When you sow the seeds place the flats on perfectly level land in a warm situation and if likely to be molested with dogs or chickens, make a frame of boards eight inches high and cover the frame with chicken fence wire.

When you transplant them place the flats in a similar way and shade the plants for the first 24 hours or until they get established. The soil for these flats should be very rich and mellow and it would pay to run it through a screen of ½-inch mesh. I have found it a good plan to cut a piece of burlap the exact size of the flat and after sowing and covering the seed lay the burlap over the top, but do not water until all are in place in the frame. Examine the boxes after the first 48 hours and when the seed has germinated and is beginning to push through, remove the burlap. This method requires less water and does not displace the seed. The transplanted plants will have to be looked after daily to see they do not suffer for water. They should be well watered before taking them to the field and taken from the flat as planted. Use for a tool what is known as bricklayer's pointing trowel—the largest size. This tool enables you to cut out a square of soil with each plant. No greater abomination in the way of a tool was ever offered than

Spraying for Coddling Moth.

We have a small orchard of apples, peaches, plums and apricots. The apples are wormy, the peaches have split pits, apricots big crop, but fruit very small. Can you tell me what to do for these things? Have sprayed my strawberries with Bordeaux mixture when the vines were full of bloom. Some are now full of green fruit. Will the spraying injure this fruit or make it poisonous?—R. B., Compton.

There are several questions here which to answer fully would require much space. No one treatment fits any two of the cases. The apples, to prevent from being infested with the coddling moth or the worm, should be sprayed with Paris green, 1 lb. to 200 gal. of Water. Directions later. The split peach pits is a question which Prof. Ralph E. Smith of Whittier is investigating and which has never yet been satisfactorily answered as to cause of remedy. It is barely possible that spraying with the Bordeaux would be of value for that, but sure it is that if

Montana farmers are urging the National Congress to give relief from smelters whose fumes cause destruction of all vegetable growth within long distance of the smelters.

peaches are infested with curl leaf, that spray is of exceptional value. Do not add Paris green or acetate in such a case. The spraying with Bordeaux on strawberries will not poison the fruit as we assume there was no necessity for adding the arsenate to that spray. Always bear in mind that the arsenate is only for insects which eat of the leaves or fruit while the Bordeaux is only for a fungicide. The apricots can only be handled by thinning at fruiting time or rather before the fruit attains any material size in the springtime. It is very probable that this year you will not have sufficient to require it, but if the trees are heavily loaded thinning will aid you to secure better sized fruit.

Water Required.

How many miners' inches must be developed to irrigate 5000 acres of land to be planted to vines and trees in this section? Loss of water when run over a mile is over 30 per cent. Temperature often 110 with scant rainfall in winter.—R. S., Wasco.

It would be impossible to give definite information in answer to such a question, as local conditions, kinds of fruits, especially texture of soil and subsoil would be the determining factors. Roughly, or as a mere guess, we might say 1,000 miners' inches of water. That would be an inch to five acres which many orchardists think is required for best results especially on sandy soil. Others have done with an inch to eight and some with an inch to ten acres, while some sections of your valley have had good success with vineyards with no water at all. Of course this could not be done with you.

Pears Immune to the Blight.

Does the blight affect all varieties of pears alike? If not, please give names and descriptions of varieties least affected.—W. E. L., Lemoore.

There is a material difference in the effect of blight on varieties of pears. Some which happen to be the less desirable are the more resistant. Among the most desirable varieties which are to a certain extent resistant are the Winter Nellis, but unfortunately these do not bear well in many sections of the state. The Le Conte is also resistant to a certain extent. It has been advised to use this stock on which to graft the more desirable varieties. There are at present many tests being made which may add to our knowledge on this subject in the near future. The Bartlett, one of our very best pears, is one of the most susceptible. Those less susceptible are Le Conte, Winter Nellis, Seckel, Angouleme and Lawson.

Grafting Vineyard.

I have ten acres of vineyard, planted to Mataro and Carignane wine grapes. Vines are eight years old and bore last year about six tons to the acre. Soil is decomposed red granite. I have a few Red Emperor vines adjoining, one year old or rather two this spring and there were one or two bunches on vines this year; they were good color. I am thinking of grafting the 10 acres of wine grapes to Red Emperor, as wine grapes did not pay well this year and I have heard that the Red Emperors were fine shippers.—J. J., Escondido.

On red soils like those of Escondido the red grape are almost certain to color well. Now as to planting to Emperors, personally I am going slow at present. I have sixty acres of them on the home ranch, and about thirty on the Palomitis ranch. Yet I have been eighteen years in building up the brand under which we are selling those grapes. They have proven profitable to me every year; even last year. Now do you think I am jealous when I tell you that the packers here complain greatly over the increased acreage and tell me that the large plantings of Tokay in the northern districts are making, each year, the marketing more and more of a problem. If we have early rains, then the Emperors are all right, for the Tokays will not stand much rain, still one does not like to be like the old Scotchman that prayed in the church, "Nay good Lord, will Thee not in thy mercy make the wee beasties of County Glen Garry ail have th' scab sore badly, and good Lord will Thou be pleased to shield the wee lambie and ewes of air flocks from the same, for we are a muckle righteous folks and give Thee the praises."

The grafting over of old vineyards seems to have been a failure and is practically abandoned in the vine districts of the state. Ten years ago there was a lot of it around here and yet, today, it is not attempted. A complete stand of shapely vines has never been secured by any one. The vines that fail to grow are either killed outright or else must be left a couple of years before they are sufficiently large again to graft. At the end of four years with the grafting and regrafting, more money will be spent and less vineyard to show for the money, than though the old vines had been removed and a new vineyard started.

As to table grapes for Eastern shipment. Are your freight rates such that you can compete with the Sacramento valley? We have this hauling always to consider in California. With the Imperial Valley to supply the Arizona and Southwestern trade, it looks doubtful, and the local market is not your best market to cater to in planting of desirable varieties. The Royal Isabella and grapes of that type sell well in the local markets.

Advertise.

I am always interested in reading the poultry page of the Cultivator, and would like to ask if you could give me name and address of some one who has some nice Barred Rocks for sale.

I have been watching for ads in the Cultivator for some time, but don't find any, only of Chas. E. Smith of Gardena, of whom I bought last year ,and want fresh blood this year. I have a fine bunch of hens and have no trouble selling them at a good price.—Mrs. S. F.

Now it is against the rules to mention names of breeders in answer to an inquiry like this, but I send the letter and hope some of our Barred Rock brethren will take the hint and advertise stock in the columns of the Cultivator, and I assure them that they will find it an excellent medium for disposing of surplus stock—Mrs. Metcalf.

"Wind Pudding" for the Calf.

Please tell me through the Cultivator if the foam from fresh separated milk will be injurious to calves? I have been told that it will kill them. —O. W. R., Selma.

The foam on the skim milk from the separator, "wind pudding," is not poisonous. It is simply whipped milk. I can understand that if one calf in a herd should receive it for his portion he might, after a few days, look as though he had been starved. By placing the milk where it will have time to settle it will be seen how small a portion of milk it really contained. Whipping is a housekeeper's device to make a small amount of cream do a large amount of work. The little granddaughter in this house begs from the cook a little vanilla and some sugar and the boys fill her little cup with wind pudding and she calls it ice cream. The cats too, love it, and little goes to the barns from the separator here, so you see I am quite sure it is not poisonous or the precious baby could not have it frequently.—M. E. S.

Abortion.

Many of my cows will come in within three months after breeding. Why?—Tulare Subscriber.

The reasons may be several for these conditions. Have these cows had an epidemic of aborting? Sometimes cows lose their calves so early that it is not noticed, while a few may carry their calves nearly full time and then the calf fails to live after birth. Some times the aborting does not occur, but the germ takes the form of the cows not cleaning after dropping their calves. A simple thing to do for these cows is to try the yeast treatment: Take a pint of lively yeast and add it to a quart of warm water and give the cow a douche six hours before breeding her. After she is bred, put her in a quiet place for a day away from the herd. The yeast, it must be remembered is a living organism and must not be killed with hot water; 80 degrees is the right temperature. I note people telling of the failure of the yeast treatment after saying they put boiling water on the yeast. The old treatment used to be hot water, a tablespoonful of baking soda in the douche, this will also bring around many cows. Now as to the sire, use him only every other day and feed

im some grain. I know that goes ard at the present prices of grain. should try to breed a couple of cows to outside sires and find out f the fault was in him.— M. E. S.

Articles which have appeared in he C. C. on contagious abortion should also be read by this subscriber and thorough disinfection of stables be made.

Various Questions.

How are palm trees started from the seed? What is the best way to raise olives from cuttings? What is best to use on nursery of young seed bed oranges to secure growth? What is right way to cure up buds for spring budding for young orange trees? Or are fresh buds better?—L. C., Lindsay.

Palm tree seed is planted very much as corn would be planted and raised in the open. Of course we refer now only to the hardier varieties which grow readily out of doors. There are some varieties like the Kentias which are very difficult to propagate and require the glass house and experienced handling. Olive trees are reproduced from the small herbaceous cuttings which require hot house bench or from the large cuttings or truncheons. For the latter method of growing take cuttings at this time of the year say the size of a lead pencil or up to one inch in diameter and ten to sixteen inches in length and set deep in row leaving only two or three inches above ground. We assume by question three you mean fertilizer. The quickest acting would be a very small amount of nitrate of soda applied to the soil dissolved in water. But probably the best and safest way is a thorough mulching with cow manure over the seed bed immediately after the seeds are planted. We do not understand what you mean by curing up buds unless it is in selecting the wood for the budding to choose only ripe, well rounded buds. You will not be troubled with getting any fresh growth at the spring budding time. The buds are not cut from the trees until ready to use or if kept any length of time it is necessary to see that they are kept moist and not allowed to dry out until ready for use. Packing in moss or damp sand is the best way for preserving them.

Egg Preservative.

Please give the best egg preservative.—J. G. H., Enterprise, Oregon.

The best of all egg preservatives is water glass and the method of handling it will be given in the Cultivator within the next two or three weeks. Of course cold storage is probably the better way, but we assume the inquirer is asking for the farm method of preserving them.

Paint for a Flume.

What is the best kind of paint for an old flume that leaks?—A. L. P., Carpenteria.

Your queries regarding pruning of berries has been forwarded to Mr. Lobingier, excepting that about logan berry pruning which was fully described in our issue of October 15. The question of paint for an old flume is a hard one to answer so as to give you satisfactory information. At best you will probably have trouble with it after painting. A good application of coal tar is probably the best of anything that is within the line of reason as to cost. Probably the trouble is that your flume is up out of the ground where the sun has opportunity of warping and pulling apart the joints. Where they have been too bad we have seen the cracks calked with old rags, and then soaked with the tar.

Farcy Remedy.

In the veterinary department of the Cultivator a couple of weeks since a subscriber asking for help for his horse which showed certain symptoms of farcy, was advised that if farcy or glanders existed they were incurable and the horse should be slaughtered at once. A subscriber takes exception to this and gives the following formula which was given to him by a practising veterinarian which he declares has cured horses for him.

Nitrate Potash 2 ounces.
Sulphate Iron 2 drams.
Antimony 2 drams.
Powdered Gentian 1 ounce.
Soda Bicarbonate 4 ounces.

Dose, tablespoon twice a day on wet feed.

Veterinary.

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Looseness.

I have a ten year old horse in good flesh and health, but when not at work becomes loose in bowels. As soon as he is put at work, trouble leaves and condition becomes normal. I feed oat hay of good quality with rolled barley and bran added to ration when at work. What is cause and what treatment would you recommend?—Rancher.

This is caused by excess of fluid in bowels which is carried off other ways when the horse is working. Get the following; powdered chalk one pound, gallic acid one-half ounce. Mix and give teaspoon heaping full twice daily in feed, gradually increase until results are apparent.—R. T. W.

Abscess.

Our cow had an abscess on her jaw which broke and healed first on one side and then the other. Now she has several small ones like boils on her ribs near the back bone. These break and water runs out. She is a young cow, always has been very healthy and fat, but is thin now. She eats plenty, but has gone quite off her milk. Should we use her milk?—J. J. J.

The abscess on the jaw should be kept open until healed from the bottom. Wash clean and afterward use tincture of iodine inside the sore. The sores on the back should be treated the same way. Examine them closely to see if there are not "grubs" in them. I think there is no objection to using the milk.—R. T. W.

Mallein.

What effect does the mallein test have on an animal affected with glanders; also effect on a healthy animal?—X. Y. Z.

Mallein has no apparent effect on a horse not having glanders.

The effect on a horse with glanders is different depending on the amount of glanders "germs" in the horse. In the average case it produces a rise in temperature, ranging from two to five degrees. Temperature commences to rise eight to twelve hours after injection, gradually goes to maximum, then slowly falls to normal.

On a glandered horse there will be some enlargement and soreness at point of injection and often stiffness, and a general disturbance of the whole system, which may last for several days.

The effect of mallein is always most marked in animals showing only slight symptoms of glanders. Horses with very marked symptoms are affected peculiarly, but the general symptoms are usually sufficient for diagnosis in these cases.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces. excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

A BIG PUMP.

During the past week the Byron Jackson Company of Berkeley and San Francisco shipped a 3000 gallon pump to the Pacific Reclamation Company's works at Magill, California. This pump is guaranteed to raise 8000 inches of water in 24 hours.

With a large factory at Berkeley the Byron Jackson Company is able to furnish pumps of any capacity for ordinary and special work. They also submit plans for any particular irrigation project and design special machinery to meet special requirements.

A large, illustrated catalogue giving complete details of different styles of pumps, engines and supplies will be issued shortly. This book should be in the hands of every one who is interested in irrigation and general machinery requirements. It will be sent free upon publication if you mention the California Cultivator.

IT'S PENNY WISE

Policy to set out a good tree, costing good money, and then let the sun burn the bark or the rabbits gnaw it, when for $1 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow street, Los Angeles.

The Glen Ellen Grange is petitioning the legislature to amend the Cartwright law so as to make the creation of monopolies a felony.

300,000 Feet Water Pipe Cheap

ALL SIZES

150,000 feet of this shipment is second-hand pipe, practically as good as new, and is now on sale at a big discount by the Adams Pipe Works, 2025 Bay street. To reach the Adams Pipe Works in Los Angeles, take car marked Pacific Boulevard, starting east on Seventh street from Broadway. Ask conductor to let you off at Bay street and go east half a block. Phones, F1917, Broadway 1264.

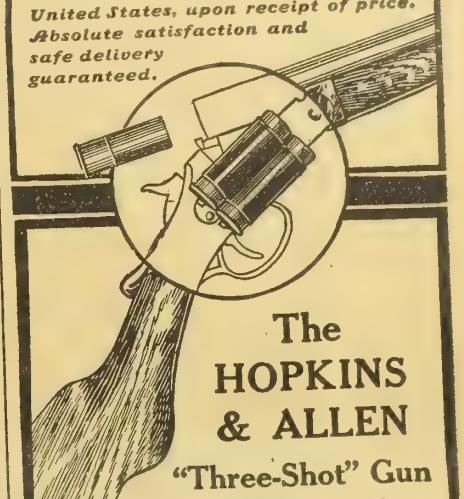
This quick-firing "three-shot" gun is the handiest and most up-to-date article ever made in the shot-gun line. It's yours for $8.00

Sent by express, prepaid, to any address in the United States, upon receipt of price. Absolute satisfaction and safe delivery guaranteed.



The HOPKINS & ALLEN "Three-Shot" Gun

is unequalled for quick shooting. The three shots, one in the gun and two in the clip, can be fired with the rapidity of a repeater. No more missing good shots because your ammunition isn't with your gun. There are always two shells in the clip. No need of keeping a loaded gun in the house—a shell is slipped into the breech at a second's notice. Your gun is always ready for a shot at hawk or game, and you don't have to hunt for shells while the game gets away.

You were never offered a gun as good as this for the price.

Fine decarbonized steel barrels bored full choke for close shooting and deep penetration. Frame case-hardened. Stock and fore-end fine walnut. Top snap action, locks automatically, and joint takes up its own wear. Rebounding hammer, rests in safety notch after firing, eliminating danger of accidental discharge. Hard rubber butt plate. This gun is guaranteed to shoot factory-loaded nitro powder shells. 30 or 32 inch barrels. Automatic ejectors.

1908 GUN GUIDE, FREE!

Our Gun Guide and Catalog for 1908 describes in full 11 styles of double guns, 8 styles of singles, 10 styles of rifles and innumerable kinds of revolvers. Gives lowest prices and offers most complete line. No sportsman or gun lover should be without it. Write for it now.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

BE STRONG.

Be strong!
We are not here to play, to dream, to drift;
We have hard work to do and loads to lift.
Shun not the struggle; face it. 'Tis God's gift.

Be strong!
Say not the days are evil—who's to blame?
And fold the hands and acquiesce—O shame!
Stand up, speak out, and bravely, in God's name.

Be strong!
It matters not how deep entrenched the wrong,
How hard the battle goes, the day how long.
Faint not, fight on! Tomorrow comes the song.—Maltbie D. Babcock.

A Quiet Home.

THE PARROT AND THE PHONOGRAPH.

THE Crawfords had a parrot and the Beldens had a phonograph, and a narrow hall separated them.

"I'd rather be sentenced to occupy a cell in 'Bankers' Row' at the penitentiary than have to move," said Crawford, "but it looks to me as if we'd have to get out. That phonograph is going to make a nervous wreck of me if I have to listen to it much longer."

"I'm glad," his wife replied, "that you are coming to your senses at last. If you had listened to me last spring we would be nicely settled somewhere else now and all this trouble would be over with. If you find it nerve-racking, when you are here for a few hours at night and in the morning, what do you think of the effect it has on me, being here all day? I heard today of some new flats in a lovely neighborhood. If you like I'll go and look at them tomorrow."

While the Crawfords were discussing the matter Belden was informing his wife that his endurance had about reached its limit.

"That parrot," he said, "is going to make a raving maniac of me if I can't get away from it pretty soon. If I owned a flat building I wouldn't let a family with a parrot into it any more than I would think of admitting people who were stricken with the plague. By George, I wish there might be some way of getting rid of the nuisance without causing a general disturbance."

"There is a way, Henry," his wife answered, "and I've been seriously considering it, although I haven't wanted to say anything to you until I was sure about it, for I didn't want to be disappointed if it didn't happen to be possible. I have been inquiring about some new flats that are going to be very attractive, and if we wish to engage one of them now we can get it for just what we are paying here. Aside from the parrot, the new place will be much more desirable than this and—can't you go over with me in

the morning to take a look at it before starting down-town?"

Belden argued feebly against moving, but at length permitted himself to be won over, and after he had seen the new flat he became enthusiastic.

"It will be just as well," he said, "not to let the Crawfords know that we intend to get away—at least not until we are all ready to move. There's no use having a quarrel with them if we can avoid it. They would, of course, jump to the conclusion right off that we were trying to get away from them if they found out about our intention to go, for I've spoken to several people about the parrot. Crawford's all right, but his wife is a regular spitfire. I don't want you to get into any scolding contest with her. Start the machine. Let's have a little music."

A day or two later Mrs. Crawford met Mrs. Belden on the stairway.

"I suppose," said Mrs. Crawford, "you have no intention of moving this spring, have you?"

"Well," replied the other lady, feeling a little guilty, "we haven't thought much about it. My husband hates moving, so that I'm always afraid to mention the subject to him. I suppose we'll have to stay and make the best of it here."

"Go way! Go way! Get a move!" yelled the parrot in Mrs. Crawford's flat.

When Crawford got home at night his wife said:

"I had hoped the Beldens might be thinking of going, so that it wouldn't be necessary for us to do so, but they're not. I had a talk with her about it today. So we may as well decide right away whether to stay or not."

"They've decided for us," her husband declared. "We will have to go; so you may as well begin making arrangements. But don't let the Beldens know anything about it. We may as well leave on good terms with them if we can. Hello Polly!"

"Hello! Help!" screamed the parrot.

During the next two weeks things were strangely silent in the Crawford and Belden apartments, except for occasional hammerings; then one morning two large vans backed up in front of the building, and at last the secret was out. The Beldens knew the Crawfords were moving and the Crawfords knew the Beldens were off to a new habitation. Both women kept in their rooms, and the men, avoiding each other, started away, leaving the movers to handle things as they pleased.

Belden had been sitting for ten minutes on the front steps of the new flat building, when he perceived coming up the street a man who seemed to be in a hurry.

"Hello," he said to himself a moment later, "it's Crawford!"

When he reached the place where Belden sat Crawford paused, making no effort to conceal the fact that he was surprised.

"Are you moving in here?" he asked.

"Yes," said Belden; "are you?"

After Crawford had answered in the affirmative the two men looked at each other silently for a moment. Then a smile began to break over Belden's countenance and another appeared upon the visage appertaining to Crawford.

"What do you say to a little walk around the corner?" Belden suggested.

"I was just going to invite you," said Crawford.

They had not returned when the women and the vans arrived.—Chicago Record-Herald.

About the House

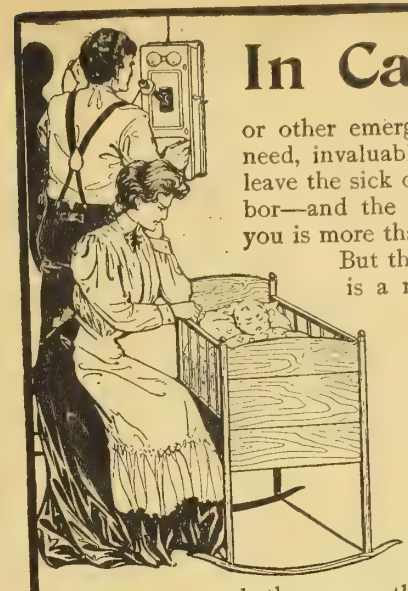
WHENEVER it rains in the winter time there is one thing that will make me perfectly happy—and that is to go in the kitchen and cook something. If I can bake, or boil, or fry, when the rain is beating against the window panes, "I ask nothing more of gods or men." So this morning after the breakfast dishes were disposed of I made doughnuts, and how I enjoyed it. When I had finished, a great heap of crisp, brown, sugary cakes rewarded me for my morning's work. They tasted as good as they looked and as this is the doughnut season I will tell you how I made them.

Beat one cup of sugar and two eggs very light. Add one teaspoon melted butter or lard, one cup sour milk, one half teaspoon salt and a little cinnamon. Mix one level teaspoon of baking powder and one half of a level teaspoon of soda in one cup of flour and stir it in, then add enough flour to make a soft dough. Roll out about one third inch thick, cut in rings or twists and cook in hot fat.

I wonder if any of the Cultivator readers have not learned of the many good qualities of the Hubbard squash. I confess that I cooked my first one only a few years ago. I sawed the squash in two equal parts and scraped out the seeds and stringy parts and then baked it in the oven. I served one half "in the shell," each person seasoning her helping with pepper, salt and butter. I say "her" helping for my husband refused even to taste it—said his mother never cooked squash in that way.

The next day I served the other half of the squash in a great golden heap seasoned and prepared like potatoes, but that misguided man refused the dish because he "didn't like squash anyway." But the next week I put before him a "pumpkin" pie, made of squash and then he admitted that "squash was good in its place," and he thought the place was pumpkin pie. The recipe for the pumpkin pie came from a noted chef in New York City, and it makes a delicious pie, using either pumpkin or squash. Cook and strain the pumpkin or squash and for three pints allow two tablespoons of flour, five eggs, one pint of sugar, one tablespoon of ground ginger and a little nutmeg, one teaspoon of salt and two quarts of milk. Mix all well together while the pumpkin is hot, or set the mixture on the back of the stove to warm. Line the pie pans with a good paste, fill as full as possible and bake in a moderate oven for about an hour.

A perennial remedy for colds is flaxseed lemonade. Pour a quart of boiling water over a teacupful of flax seed; add the juice of two lemons and enough loaf sugar to sweeten. Cover and steep for several hours. Strain and drink hot just before going to bed.



In Case of Illness

or other emergency the telephone is a friend in need, invaluable and incomparable. No need to leave the sick one to summon the doctor or neighbor—and the time required to get assistance to you is more than cut in half.

But the emergency value of the telephone is a matter of reliability and efficiency.

Western Electric Rural Telephones

are telephones of proven reliability. Over 4,000,000 Western Electric Telephones are in daily use. This means confidence. Think it over.

All of the material needed to build the very best rural telephone line—exactly the same as the Bell Company puts up—will cost you and your neighbors only about as much as two or three sheep. With our Free Bulletins before him a boy can install and operate the system

GRANDPA'S WAY.

Somehow, through all the day we children used to dread
When night would come, and mother'd say, "Now children, go to bed;"
Till grandpa came to visit us. He was a soldier, and you see
He's just as good and pleasant as ever he can be.
The very first night he asked mother with a smile
If the children ever marched to bed in good old soldier style.
Then he commenced to count: "One, two, one, two." I tell you it was fine,
And you don't know how quickly we all fell into line.
Since then, all day we kind of look ahead
For night to come when we, like soldiers, can march away to bed.
And grandpa says, if we've a task, we'll find it just the same—
It's so much easier to do if it has a pleasant name.

—Florence A. Hayes.

Hay.

Somers & Co. say: Although railroad traffic has been tied up in many places, yet we do not believe that this will affect the receipts of hay in San Francisco for most of the supplies are at points where freight is being handled on schedule.

Alfalfa continues very firm and although the market may possibly be short for some little time owing to the fact that our principal supplies are now being brought from Nevada and Northern California points, yet we are of course in hopes that freight traffic will be resumed shortly and that therefore our market will be supplied with this article.

Citrus Market

LOS ANGELES, Jan. 27, 1909.

The continual storms in the orange sections have caused a shortage of shipments so that the Eastern demand at present is very strong for the few which are going forward. No day now sees in an excess of 100 cars shipped out, while it is common at this season of the year for shipments to approach a total of 200 per day. No fancy prices are being received but a good, healthy tone prevails, which now promises to continue.

The lemon market is also satisfactory. Report says that vast quantities of foreigns are afloat and due to arrive in a short time. Prices for such as have been shipped have been very satisfactory to the shipper.

The Shipments.

Shipments of oranges from Southern California to date since November, 1, are 3328 cars, and of lemons 982.

NEW YORK, Jan. 22.—Five cars navels, one mixed car and one car lemons sold. Market is unchanged on both lemons and oranges. Weather clear and mild.

SPRING FLOWERING BULBS.

(Continued from Page 89.)

coolest part of the grounds, and in some location where they will be shaded for at least part of the day. I think that an angle on the northwest corner of a building, not close to the building, where they will be shaded until about one p.m. is the best of all locations. The partial shade of trees is as good, but in that case care must be taken that the trees do not rob the bulb beds. Splendid flowers can be grown in a southerly exposure by giving artificial shade. This in the shape of lath screens, or even tall brush stuck by the beds. Larger and better developed bulbs will be produced in this way than by the other, but the difference does not justify the trouble in other than commercial places.

BERRY PLANTS.

FOR SALE—MILLIONS OF STRAWBERRY plants, all the standard varieties; many varieties blackberry, raspberry, Logan, Himalaya, Mammoth, dewberries and fruit trees. Special prices. Muscat and Flaming Tokay cuttings (disinfected,) $3 per thousand. Write us your wants. TRIBBLE BROS., Elk Grove, Cal.

Classified Liner Columns

Rates 1½ cents per word per issue. No ad. accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad. for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

FARM LANDS FOR SALE.

IMPERIAL VALLEY—DO YOU WANT to help us pioneer the **Weston Townsite** and get paid for it by getting in on the ground floor on the first 10 acre tracts, "without money and without price?"

We can offer a few 10 acre lots surrounding the Townsite at $1000.00 each, to be paid for in work on adjacent tracts or on a share basis of planting to oranges or grape fruit or to vines and deciduous trees. WESTON is situated in the centre of the famous No. 8 Water District and has more than 50,000 acres of the finest garden soil in the Valley tributary to it.

Remember the history of the townsites of Brawley, Imperial, El Centro, Holtville and Calexico and profit while you may.

If you are free to go there we can help you and you can help us. For particulars apply to IMPERIAL INVESTMENT CO., 315 H. W. Hellman Bldg., Los Angeles, Cal.

FERTILIZERS.

PROFIT IN FERTILIZING depends as much on judicious purchasing of fertilizers as on the intelligent study of the requirements of the crop. You may get the analysis you want, but from cheap materials of slow availability. When you buy ARMOUR'S ANIMAL FERTILIZERS you are assured of the highest grade of materials. They can be depended upon for results. Send for copy of "Fertilizer Facts" THE ARMOUR FERTILIZER WORKS Los Angeles, Cal

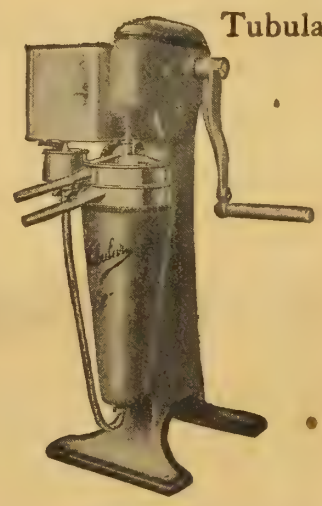
The Sign of Satisfaction

QUALITY has made the Sharples Separator Works the largest factory of its kind in the world. Quality has made the sale of Tubular cream separators greater than that of any other separator. Quality will be found in every part of the 1909 Tubular "A" separators and will place Tubular cream Separators still farther in the lead.

We wish ebery dairyman who reads this could come to our factory and see for himself the difference between Tubular "A" separators and other separators, thousands of which come to us each year in exchange. We would like to demonstrate to every dairyman the many points of superiority in Tubular "A" separators, a few of which we mention below:—



Tubular "A"

Perfection in skimming,
Extreme simplicity of construction,
Remarkable ease of cleaning,
Most convenient oiling arrangement,
Low, convenient milk supply tank,
Freedom from complicated bowl parts,
And twenty other especially desirable features.

Our free catalog No. 260 will tell you all about it. Ask for it.

Amygdalina, Regnans in California

An Account of the Tallest of the Eucalypts. Written Especially for the California Cultivator By J. Blackburn, of Maryborough, Victoria, Australia

THIS species has attained universal prominence through the writings of the late Baron von Mueller and other scientific men, who claim for it a height not surpassed by any tree in the world. Recorded measurements are given in the Baron's "Eucalyptographia" and "Select Plants for Industrial Culture," taken by such men as Professor Wilson, Colonel Ellery, A. W. Howitt, the Reverend I. Ewing, Mr. D. Boyle, Mr. Rollo, Mr. Walker, and Mr. G. Robinson, the last named sending in a record of 471 feet for a tree measured by him at the foot of Mount Baw Baw in Gippsland. The others assert that they had met with trees varying in height from 400 to 540 feet. It would be out of place for the writer of this article to make any comments upon statements evidently made in good faith, but I would like to bring this fact before my readers that I never measured a tree of Eucalyptus Amygdalina more than 320 feet high or heard of an authentic measurement exceeding 380 feet and I have spent many years in the forests where this eucalypt flourishes.

Still, although our tall monarchs of the woods may have to be shortened, I do not think, (given favorable conditions) that any tree in the world surpasses it in celerity of growth or excels it in quick production of useful marketable timber. Eucalyptus Amygdalina regnans flourishes in sheltered valleys and on table lands in a deep, porous, granitic soil at an altitude of from 1000 to 3000 feet above sea level, where the annual rainfall ranges from 40 to 50 inches.

There are large forests of this tree now being operated upon by sawmillers and splitters in the valley of the river Yarra near Warburton, Victoria, that have sprung up since "Black Thursday" in the year 1851, when a terrific fire swept over nearly all the colony of Victoria, killing the primeval trees largely. The yield of timber, sawn, varies from 40,000 to 100,000 feet super per acre, exclusive of mining laths and palings. A correspondent of mine, one of our State Forest staff, assures me that he has seen 8,000 six feet palings taken from one tree and has measured another containing in the log 15,000 feet super of timber, sound to the heart. Some of the old trees girth 80 to 90 feet at five feet from the ground, but of course they have taken centuries to attain such colossal proportions. This eucalypt is a profuse seeder and when an old forest is cleared away or used up, a young one quickly springs up to take its place. No need for replanting. It is rather subject to the attacks of white ants when growing in deep, dark, wet gullies and owing to its thin bark is easily killed by severe forest fires. It is one of the hardiest of its cogeners and is stated to have braved in certain localities unusually cold winters in Britain. On poor, shallow schistose soils, the growth of this species is much retarded. A deep soil, therefore, is essential for its quick development.

The wood is useful for housebuilding and carpenter work. In drying it does not twist, and most trees split better into palings and mining laths than our stringybarks do. The timber is light enough to float in water, a rare quality with eucalypts generally. It is well adapted for staves, shingles, palings, rails, etc., and is also drawn into use for shipbuilding. It is not lasting underground.

The leaves are rich in essential oil which was first distilled and brought extensively into commercial use by the late Mr. I. Bosisto of Melbourne many years ago.

In conclusion, I would like very much if the readers of the Cultivator could see the Mountain Ash in its native home, generally a sheltered ravine with a clear, pellucid stream running through it. Such a wealth of vegetation adorning it! Beautiful sassafras and umbrageous beech, festooned with mosses and Lycopodium, intermingle with the tender, silvery foliage of the wattle and the darker hued blackwood, the palm like tree ferns, Dicksonia antarctica and alsophyla australis, etc., rearing their frond crowned heads to a height of 50 feet, and far above all, the tall, straight, white trunks of the Mountain Ash, towering aloft hundreds of feet toward the sky like the pillars and arches of a vast cathedral, present a picture never to be forgotten. You feel that you are in a sanctuary, not made with hands, where

As to shame the temples deck't
By skill of earthly architect,
Nature herself it seems would

* * *

A minster to her Maker's praise.

In addition to the above description sent us by Mr. Blackburn, we may be permitted to quote from McClatchie's "Eucalypts Cultivated in the United States." The first paragraph given however while from that book, is there quoted from Baron von Mueller's "Eucalyptographia."

"This Eucalyptus is one of the most remarkable and important of all the plants in the whole creation. Viewed in its marvellous height when standing forth in its fullest development on the slopes, or within glens of mountain forests, it represents probably the tallest of all the trees of the globe; considered as a hard-wood tree of celerity in growth, it ranks among the very foremost; and contemplated in respect to the yield of volatile oil from its copious foliage, it is unsurpassed and perhaps not equaled by any other tree in the whole world."

Mr. McClatchie then says: "While claiming that this Eucalyptus is the tallest tree in the world, Baron von Mueller admits that in respect to height combined with diameter, 'it must cede the palm of superiority perhaps' to the Sequoias of California. In most other countries outside of Australia, this Eucalypt has not attained extraordinary heights; nor does its rate of growth prophesy great size. In the Southwest many other species grow more rapidly and have attained greater height since their introduction.

"The tree is a very variable one, the size and habit depending upon the soil and the climatic environment. The great heights mentioned are attained in cool, moist ravines. Baron von Mueller says that in more open country it is of much lower stature, in some cases being comparatively a dwarf. It is the latter form that is known as 'Peppermint Tree.' In the Southwest it is exceedingly variable, running into forms that are evidently worthy of varietal names. The bark is also quite variable, being either rough and persistent or flaking off and leaving a smooth, yellowish surface. The trunk is fairly erect, but the small branches usually droop willow fashion. The leaves are of medium size, varying from very narrow to lance shaped. They are usually more or less curved. The narrow leaves are quite thick, the wider ones thinner. They are equally green on the two sides, and commonly have a distinct odor of peppermint when crushed. The flowers are small, in compact clusters of 8 to 15. The seed cases are small and nearly top-shaped.

(Continued on Page 142.)

EUCALYPTUS AMYGDALINA, REGNANS

Foliage and "fruit" of the tallest of the Eucalypts. In Australia this tree has grown to heights of nearly 400 feet has done well near the coast in California. The wood is softer than many of the other varieties and fine for finishing.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials

THE O. & W. THUM COMPANY

Manufacturers of Tanglefoot Fly Paper Grand Rapids, Michigan

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

With the Citrus Growers

A FEW INSECT FRIENDS.

IN the constant warfare against insect pests the agriculturist often overlooks the fact that there are a great many insects that are in no sense his enemies, but on the other hand may be numbered among his best friends.

There are many ways in which insects are beneficial. Some are of commercial importance; others are valuable in that they act as agents in the pollination of blossoms, some of which, it is said, cannot be pollinated except by insects. Still others are scavengers and perform a valuable service by destroying decayed matter of various kinds. The forms that the entomologist recognizes as pre-eminently beneficial are those that destroy injurious insects, either as parasites or as predaceous enemies; the former living within the body of their host, the latter destroying from without.

In this article it will suffice to mention three families of predaceous insects that are invaluable because of their habits of feeding upon plant lice, viz.: "Coccinellidae, or lady bird beetles; Syrphidae, or syrphus flies; Chrysophidae, or lace-winged flies. Especially are these insects friends of the orchardist, and he should familiarize himself with the different stages in the life history of each. A little study and observation, along with the help of an entomologist, is all that is necessary in order that he may be able to do so.

The little cluster of a dozen or more bright yellow eggs found on trees infested with aphids-is a familiar sight to every orchardist; yet how many there are who do not know that from this little mass of eggs will hatch the ravenous larvae of some species of lady-bird beetle, which are especially fond of plant lice for their food. The eggs of the lace-winged flies have attracted the attention of nearly every one, because of being attached to some part of a tree by means of a slender stalk or pedicel; yet how many are not aware that from these eggs will hatch extremely ravenous little creatures, whose appetite for plant lice seems all out of proportion to the size of their tiny stomachs. The eggs of the syrphus flies are not so familiar, but a careful search will reveal their presence as small, whitish, oblong eggs, deposited singly and almost invariably within the immediate vicinity of a colony of aphids. From these eggs hatch little larvae, which are also very fond of plant lice.

The third, or pupal stage in the life cycle of these insects, should be recognized by all. The lady-beetles, when ready to pupate prior to their transformation to the adult stage attach themselves to some part of a tree or plant by the tail, and there hang in a dormant condition until transformation to the adult stage takes place. The larvae of the lace-winged flies roll themselves up into a ball and make a little white, spherical egg like a cocoon, within which transformation to the adult stage takes place. These cocoons may be found on leaves, under loose bark, etc., and should never be destroyed. The syruphus flies make a cocoon about one-fourth of an inch long, brownish in color, and tapering toward one end. They may often be found beneath the surface of the ground at the crown of a tree.

Nature tries hard to preserve a balance whereby the injurious forms of insects will be kept in check by their enemies so that plant life may not be too great a sufferer. Artificial conditions brought about by man have tended to destroy this balance so that pests are inevitable. Too much stress, however, cannot be laid upon the importance of knowing the beneficial as well as the injurious forms, so that the former may receive protection, while the latter are destroyed.—Geo. P. Weldon, Colorado Agricultural College.

GUMMING OF NURSERY TREES.

It is quite a common occurrence for young citrus trees to be affected with a form of gum disease either in the nursery or immediately after planting in the orchard. This trouble consists in a breaking out of gum at different points on the tree, which gum may be easily seen to originate from beneath the bark, breaking out through ruptures to the surface. If the gumming occurs soon after the trees have been pruned or cut in any way it usually appears at the point where the cuts have been made. Gumming very frequently takes place at the point where the cut in the bark is made for budding, and in some seasons a considerable loss of buds is experienced in this way, both in the nursery and in older trees which are being top-worked. This takes place particularly in seasons of abundant rainfall in the spring. Other cases occur with young trees where the gum appears beneath the forks and crotches, at the junction between one growth and another, or at any point where the flow of sap is somewhat interfered with. This trouble almost always occurs under the conditions just mentioned as to rainfall, or where the trees have been heavily irrigated and the water allowed to stand close about them, on trees planted in very heavy soil and often where the trees are planted too deeply with the bud union covered to some depth. The whole matter of gumming of young trees is indeed quite an obvious case of cause and effect, illustrating the relation between citrus gumming and an excess of water, depth of planting or mechanical injury. A large number of trees show more or less gumming during the first year in the orchard, but usually without serious consequences if they are properly attended to as to depth of planting and moisture or drainage conditions, unless they have been too badly affected to recover. Some trees which were affected in the nursery may continue to gum in the orchard, even under good conditions. If well taken care of they will usually recover.

Control of Gum Disease in Young Trees.

In the nursery gum disease is almost always caused by too much water close about the trees. When due to rainfall this can not always be avoided, but the choice of location for the nursery should be one of good drainage and not too heavy soil. In irrigation the water should not be allowed to flood the trees. If the trees become affected in the nursery they should be kept particularly well cultivated so that there is no packing

of the soil about them, the soil should be kept from burying the trees above the proper depth, and particular pains must be taken to prevent water from standing about them.

When young trees in the orchard show gumming, the same treatment should be given and the same precautions exercised. In case the trees gum when everything seems all right in these respects they may be still showing the effects of disease contracted in the nursery, and recover of themselves, without any treatment. If a considerable amount of gumming occurs on the trunk of the young tree it is advisable to relieve this condition somewhat by slitting the bark in a few places, as previously described. In young trees it is not advisable to strip off the whole bark at the gummed places, as some of it is still alive and might recover. It is better to plant a new tree than to start with one having a large amount of bark removed.

FOOT-ROT.

The true foot-rot, as described in Florida and many foreign countries, is not of common occurrence in California, where the ordinary forms of gum disease are evidently of a somewhat different nature. The latter particularly do not show a decay of the roots, a rotting of the bark or any effect whatever below the surface of the ground. The Florida disease is decidedly different in this respect. A few cases of true foot-rot have been found in this State, and these agree perfectly with the conditions described elsewhere. In some instances the roots were badly decayed from the surface of the ground downward, even before the top of the trees showed a very serious condition. The decay starts in the bark, which becomes soft and rotten, spreading all over the main roots until finally the tree dies. There is no gumming on the sides of the trunk as in the disease which we have described as gummosis. The odor of the affected bark is disagreeable and quite characteristic.

In the cases of foot-rot found in this State the affected trees were invariably growing under conditions of extremely poor drainage and very wet, heavy soil about the roots. As the same condition is said to exist in other countries where this disease prevails, it would appear to bear considerable relation to the other forms of gum disease described. From the accounts of this disease in many countries it would appear that it has broken out in an epidemic form, spreading rapidly through the citrus districts and causing widespread destruction of groves on all kinds of soil. For this reason it has sometimes been thought to be caused by an active parasite rather than to be simply the result of unfavorable conditions. No such parasite has been identified, however, as the cause of the disease by the many investigators who have studied it, and the conclusion is quite general that its relation to soil and moisture conditions is the most important consideration in regard to its origin. Certainly in California the cause of this trouble seems to be very plainly an extremely heavy, wet condition of the soil, and the disease has shown no evidence of spreading by infection.

Control of Foot-rot.—The control of foot-rot, as it occurs in this State, is obviously a matter of improvement in drainage conditions. Most of what has been said in regard to gummosis applies equally well here. Affected trees may be treated to some extent by the methods described.—Prof. R. E. Smith in Bulletin No. 200.

HURST SPRAYERS ON FREE TRIAL

NO-MONEY-IN-ADVANCE. PAY AFTER IT HAS PAID FOR ITSELF.

LET US SEND YOU ANY OF THESE SPRAYERS—to try for 10 days, then if you buy, you can pay us cash or we'll wait till you sell your crop, then you can pay us out of the "extra profit." *We pay freight. Wholesale dealers' prices.*

Man-Power Potato & Orchard Sprayer. Sprays "anything"—potatoes or truck, 4 rows at a time. Also first-class tree sprayer. Vapor spray prevents blight, bugs, scab and rot from cutting your crop in *half*. High pressure from big wheel. Pushes *easy*. Spray arms adjust to any width or height of row. Cheap in price, light, strong and durable. **GUARANTEED FOR 5 FULL YEARS.** Needn't-send-a-cent to get it "on trial." You can get one **free** if you are **first** in your locality. Write now.

Horse-Power Potato & Orchard Sprayer. For **big** growers. Most **powerful** machine made. 60 to 100 gallon tank for one or two horses. Steel axle. One-piece-heavy-angle-iron frame, cypress wood tank with **adjustable** round iron hoops. Metal wheels. "Adjustable" spray arms and nozzles. **Brass** ball-valves, plunger, strainer, etc. Big pump gives vapor spray. **Warranted for 5 years.** *Try this machine at our expense with "your money in your pocket."* See **free offer** below. Write **today.**

Fitz-All Barrel Sprayer. Fits *any* barrel or tank. High pressure, perfect agitation, easy to operate. *Brass* ball-valves, plunger, strainer, etc. **Automatic** strainer. *No "cup leathers or rubber"* about any of our sprayers. Furnished plain, mounted on barrel, or on wheels as shown. *5 year guarantee. It don't cost you "a cent" to try it in your orchard. Get one free. See below.* **Write today.**

FREE—Get a sprayer **FREE.**—After you have tried the sprayer and are satisfied that it is just as we recommend it, send us a list of the names of your Neighbors and we will write them and quote them price and have them call and see your machine work, and for every Fitz-ALL Sprayer we sell from your list we will credit you with $2.00 or send you check if you have paid cash.

For every Man-Power Potato & Orchard Sprayer we sell we will credit you with $3.50 or send check.

For every Horse-Power Potato & Orchard Sprayer we sell will credit you $8.50 or send check.

We do all corresponding and selling. All you need do is show the sprayer, Many have paid for their sprayers in this way. This offer is good for only the **first** order in each locality. Don't delay. **Send the coupon or post card NOW.**

SOIL ANALYSIS.

The chemist can take any sample of soil, analyze it, and tell precisely all the elements and the amount of each that it contains. From this fact many farmers think that if they could only have their soil analyzed, they would know precisely what elements of plant food are deficient and know just what fertilizer to apply. Few agricultural chemists claim to be able to accomplish much in this way. Their methods enable them to get every atom of plant food out of the soil but much of this is unavailable to plants, is so locked up that they can't get at it. How much of it is in this condition even the chemist can not tell. But plants can tell and the way to learn is to ask them. With all the help the scientists can give us, the individual farmer must still solve his own problems. If unsatisfactory yields convince you that one of your fields is deficient in one or more elements of fertility, conduct a little experiment of your own. While there are more than a dozen elements that plants feed on, there are only three that are likely to be depleted. These are nitrogen, phosphoric acid, potash. Measure off an acre of the uniform soil 16 rods long by 10 rods wide. Cut this into five strips 16 rods long and two rods wide. On the first strip apply nitrogen, on the second phosphoric acid, on the third potash, on the fourth nitrogen and phosphoric acid, on the fifth nitrogen and potash. At harvest time note carefully difference in crop on different strips and compare with crop on each side of plots which were untreated. For sure conclusions, crops should be weighed. Many soils are acid and refuse to properly grow alfalfa and clover. Lime will correct this acidity. If you have trouble in getting stands of either of these crops, test soil in same way by use of lime.

The experiment stations of Ohio, Indiana and Illinois agree that many of our long tilled soils are deficient in phosphorous, and it is generally agreed that the growing of the legumes is the cheapest way to secure nitrogen.—The Epitomist.

It is a wise plan to look over the farm machinery some spare day this winter to see what repairs are needed; then order them at once and put them on the machines needing them. If this is done, there will be no "rush" repair orders to send in just as the plow or binder season comes on next year.

The gasoline engine requires about one pint of gasoline for each horse-power per hour, or one gallon for each horse-power for eight hours running. Thus, a 2-horse-power engine will use about two gallons in eight hours. Figuring gasoline at 15 cents per gallon, this engine could be run eight hours for 30 cents' worth of gasoline.

The question is often asked: "Which is the best make of machine for this purpose?" The answer to this is, select one of a standard make that is known to be good, even if it costs a little more than something you cannot be sure about. Select the machine for which you can secure repairs in a short time. It is usually best to buy from your local implement dealer; he should be able to furnish the necessary repairs and will see to it that the machine works satisfactorily.

DEAD CITRUS WOOD

Is more or less prevalent in every orange and lemon grove, i. e., trees that are unprofitable. How many such have you in your orchard? Would it not pay you to put paying trees in their stead?

Your Home Grounds

Should contain at least a few trees of the better varieties of oranges and lemons. For this purpose we have some exceptionally fine trees to offer, being grown as specimens. Possibly you would like to plant a few citrus trees about your home this season. If so, will you do us the favor to correspond with us about it?

Citrus Fruits

Historically,
Horticulturally,
Commercially.

Our new booklet gives more valuable information about varieties, methods of planting, cultivating, pruning, picking, packing and shipping than anything of its kind ever issued. Sent anywhere for the small sum of 25 cents. Correspondence a pleasure.

Deciduous Fruit Culture

By J. W. Mills

AS TO SULPHUR.

The practical dried fruit men of the country are unanimous in their opinion that it is necessary to use sulphur to prepare a sightly and good keeping article of food, in so far as peaches, apricots, pears and apples are concerned, and their opinion is based on years of actual experience and experiment. They deplore and discourage the excessive use of sulphur as they would the excesive use of anything that in excess produces bad results, and they are as honest and much more vitally interested in their position than the theoretical expert who, as is usual with the reformer, is in a measure trying to pass laws and bring about rules and regulations that will destroy a valuable industry, by criticising the methods without offering better ones as a substitute. I am sure that I am safe in saying that not one case of injury to health has ever been found from the use of properly cured sulphured fruit, and I am sure that the general health of the dried fruit consumers of the country will at least compare favorably with that of the non-consumers.

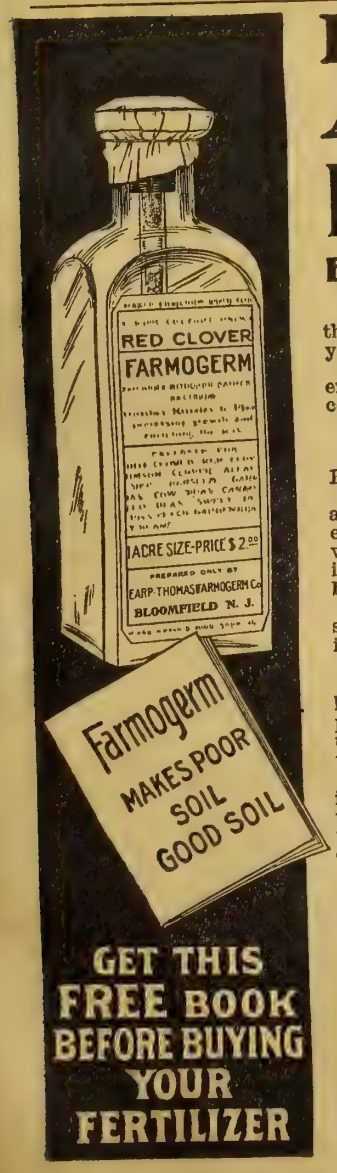
No one would welcome improved methods of curing dried fruits more than the grower and packer—I mean practical, economical methods—but up to the present time no such substitute for the present methods has been found. It is said to be true that the kinds of fruit above mentioned have been successfully cured without the use of sulphur; but while the methods, so far as I can learn, might do for laboratory experiment, and in that be successful, they are absolutely impracticable for handling the enormous dried fruit output of this country.

Dried fruit has come to stay, and is gaining firmer footing in the family every day. If the producers and merchants will see that only good, wholesome, well cured, well prepared fruit is sold, in a very short time the demand will exceed the supply.

Higher Standards.

The dried fruit business is getting on a firmer basis every year. We are coming to recognize standard qualities and gradings more and more. The business of packing and shipping is slowly working into the hands of comparatively few reliable houses, and they are doing much to establish uniform standards of quality and to eliminate that element whose methods are dishonest and unfair. Much ground for good has been gained in the last few years and the business is now on a firm, well-established footing. The only thing necessary now is to bring the packers and natural distributors together on a uniform, equitable basis.—Walter A. Frost in the Retailers' Journal.

A TWO YEAR OLD IMPERIAL VALLEY APRICOT ORCHARD.



For Larger Crops and Richer Soil At Lowest Cost Fertilize With FARMOGERM

High-Bred Nitrogen Gathering Bacteria.

Beats Nitrate of Soda at Fraction of Cost and Labor. Let us Prove it.

Before you pay a high price for a nitrate fertilizer and bear the expense of freight and the work of spreading, let us tell you about Farmogerm—

Let us show you the **sure** way to supply your soil with enough nitrates to produce several bumper crops at the low cost of $2.00 an acre, and with practically

No Extra Work.

That may sound to you as if it were too good to be true. But it is a proved fact.

You know that Government experts and practical farmers have proved the unequalled value of seed or soil inoculation with nitrogen gathering bacteria when it is properly done, **with the right bacteria in the right condition.**

The difficulty in the past has been to supply the farmer with the right bacteria in a strong, active form.

Farmogerm solves that problem.

You or anyone else may now inoculate a crop of alfalfa, any clovers, vetch, peas, beans or other legumes, knowing that the bacteria will feed that crop all the nitrates it can use.

And knowing also that the crop, being well supplied with its special bacteria, will store still more nitrates in the soil which will be available for several future crops of any kind, whether legume or not.

That is a proved fact.

One reason is that Farmogerm contains nitrogen gathering bacteria that have been carefully selected and bred up to a high point of nitrogen fixing power.

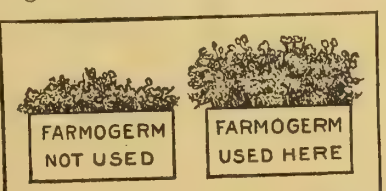
Another reason is that there is no chance of the culture being spoiled, becoming impure or being wrongly used. It will come to you in a specially sealed bottle, and is

All Ready for Use

when you get it. Just mix with water and moisten the seed or spray over the seed bed or young plants, or mix with a little earth and spread.

These are reasons why Farmogerm is successful and why you cannot compare it to any other nitrogen bacteria ever put out. These are reasons why it insures a bumper yield and a greater food value from the crop inoculated, and why it **makes poor soil good soil.**

Understand, please, that Farmogerm is no experiment. It has been tested out and proved right in a practical way by practical farmers, as well as by scientific experts. Read the letters given here and read others that appear in our book and circulars.



Prove It Like This Yourself For 10c.

We will send you a small bottle of Farmogerm for 10 cents, postpaid, so you can make a box test in your house before planting time. Then you will want more. Full instructions with bottle. Mention crop you want to test. Stamps accepted for trial size. In regular sizes, $2.00 An acre—Garden Size, 50c.

Also read in our book quotations from many bulletins put out by the U. S. Dept., of Agriculture and State Experiment Stations, showing the vast importance of soil inoculation and the wonderful possibilities of this method of fertilization.

But—"Seeing is believing"—and that is why we urge that you

Test it Yourself.

Send 10c. for a trial size, enough to make a box test in your home before planting time. The results you get in the box will make you decide to use it on every acre of legumes you plant. And you'll want to sow as much ground as possible to the inoculated legumes in order to enrich your soil for other crops next year and the next, whether the future crop be corn, wheat or other grain, cotton, tobacco, potatoes or any vegetable.

Here is another important point: You may sow an inoculated crop **with** your corn or oats, for instance, and **both crops** will get the benefit **at the same time.**

Price, $2.00 per Acre; Garden Size, 50c. By Mail or Express paid.

Write Today for Free Book No. 37 and Guaranty.

We guarantee Farmogerm to be an absolutely pure culture and to contain sufficient, strong, active bacteria to inoculate the amount of seed or soil specified. We guarantee it to keep in perfect condition for months. Let us mail you a copy of this book right away. Just send your name and address to—

Earp-Thomas Farmogerm Co., Bloomfield, N. J.

I have tried Farmogerm on beans with most gratifying results, the inoculated beans making a much more vigorous growth, maturing earlier and producing a larger crop than those not inoculated. E. W. Underhill, Syosset, L. I.

I used Farmogerm on Alfalfa, * * * * * The stand is the finest I have ever seen in this country. J. W. Pamley, Ipswich, So. Dakota.

I planted Red Clover last year treated with Farmogerm, It was greatly benefitted. This year I planted corn on the same land and on adjoining land. Corn on the land where inoculated clover was grown was better and matured earlier. Geo. T. Powell, Ghent, N. Y., Pres., Agricultural Expert Assn.

I made various practical tests with Farmogerm on my farm with clover, beans, peas and alfalfa with most satisfactory results. J. N. Hoff, New York City, Industrial & Agricultural Chemists.

I sowed 1 acre of alfalfa inoculated with Farmogerm. It has come up evenly and I have a good stand. I have tried alfalfa before but never succeeded in getting such a stand as I have at the present time. W. S. Downs, Derby, Conn.

FARMOGERM IS FOR SALE BY LEADING SEED HOUSES

REX YOUR TREES WITH
LIME & SULPHUR SOLUTION

The well known REX LIME & SULPHUR SOLUTION manufactured by the California Rex Spray Company, at Benicia, is no longer an experiment. Of the thousands of customers that used it last year, we have scarcely a single report but what is in its favor.

It is the best known insecticide and fungicide; is a tonic to the tree; is prepared on scientific principles; is absolutely uniform; every barrel that is made at the factory being of just the same strength, namely, 33% solution, Baume test; is free from sediment; is ready for use in the orchard without having to be boiled; one barrel of 50 gallons makes 600 gallons of the strongest spray, and is by far cheaper, at the reduced price at which it is offered this year, than any farmer can afford to make a home-made, imperfect solution.

Ask you dealer, or address:

(For 20 Years the Fertilizer Man)

THE PHYLLOXERA.

At the state horticultural meeting of Washington, the question arose with regard to the well-known grape pest "phylloxera." Those carrying on the discussion were interested chiefly in whether the pest existed on the vines of the grape, or exclusively on the roots. Mr. Dwight explained the pest as follows:

"The phylloxera lives only on the roots of the grape vine. After staying on the roots for a certain period of time, it undergoes a nymph stage, and crawls out of the ground on the vine itself. It remains there a short time, and then is transformed into the winged form, and that winged form of the phylloxera is the one that scatters the disease through the vineyard. In the winged form it does no damage to the vine, but the danger is in its spreading the disease.

"After the winged form has lived for a few days, it lays some eggs on the leaves of the vine. The eggs hatch and the pest crawls downward on the roots. On the European varieties it is very seldom that you can see the phylloxera on the leaves. On the eastern varieties, such as the Concord or Catawba, it is easy to see the effect of the phylloxera on the leaves, but the pest itself is very minute. In the winged form it is a little, yellow fly, the body of which is hardly as big as a pin head. Unless one is very well acquainted with the insect it will not be seen. This is why the remark is often made that 'the root form is the only one known.'

"If grape growers of the state desire to avoid the presence of this serious pest, they should be careful in the matter of importing root vines. It is dangerous to import cuttings, unless great care is taken to avoid the presence on them of the phylloxera, because they can not be readily removed by disinfection. If you give an ordinary disinfection, the pest will not be injured. If you strengthen the disinfection sufficiently to kill the phylloxera, you will also kill the root vines."

H. M. Thampke at this point said that he had been told that the phylloxera pest would not live in sandy soil, and asked Prof. Dwight if this were true.

"The sand that is referred to in this respect is the absolutely pure ocean beach sand. The phylloxera grape pest will not thrive in this kind of sand. Sandy loam is no protection. In France after the nurserymen were forced to destroy their vineyards on account of the phylloxera pests they began planting along the seaside, and in this way discovered that the pest would not live in that kind of sand."—Spokesman Review.

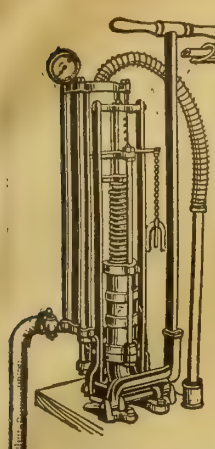
FOOD VALUE OF DRIED FRUITS.

The value of dried fruit as a food product is very little understood by the one who should be most interested, the housewife; if it were, the consumption would increase so fast that the producing sections of the country would be severely taxed to supply the demand. It is equally as valuable to the rich as to those who are obliged to count the cost of living closely. High grade dried fruit properly prepared will furnish as appetizing a dainty as ever appears on the table. The early education of most housewives leads them to believe that dried fruit is only the com-



Saves One-Third the Labor

Wouldn't you like to cut your labor expense an even third? You can do it on your spraying—and this advertisement tells you how. What's more, the work will be done more quickly and better. Use

Bean Magic Spray Pumps

The Bean patent spring (shown in the cut), divides the work; the operator does half at each stroke of the handle, and works against but half the pressure indicated on the gauge. Bean Magics are built in two sizes; both have non-clogging ball valves, porcelained cylinders, and other exclusive Bean features. They're the easiest running, least troublesome pumps on the market.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; mention number of acres and kind of fruit.

monest of food and is only to be used as a makeshift. If they would take the trouble to inform themselves as to the great improvement that has been made in curing and preparing this article for the market, and the experiments that have been made to prepare from it a dish to tempt the palate, they would be more than surprised at the important and beneficial place dried fruit would assume in their daily menu.

The average wholesale and retail buyer is equally in the dark as to the methods of preparing dried fruit for the market, and of the difference in value of dried fruit from the various sections where it is produced, and, above all, the difference in value of properly and improperly prepared fruit. If he would so inform himself and govern himself by that information, insist upon having such dried fruit as is properly handled, delivered to him on his purchases, he would make new friends and customers, both for himself and for that too often despised article—dried fruit.

Prunes for Example.

Take the one item of prunes to show how small comparatively the consumption of dried fruit is in the country. An average crop of prunes in California, Oregon, Washington and Idaho, the prune producing states, is for the present acreage from 150 to 180 million pounds, or about 2¼ to 2½ pounds per year to each inhabitant. What is true of prunes is true of other dried fruits, and yet there is not one of the many items that go to furnish the table that will show better results from its free use in nutriment, pleasure of eating and economy.—Retailers Journal.

PRUNE THE FIG.

W. F. Toomey, the fig packer of this city, has a suggestion for the improvement of the status of the fig grower and his fruit. Mr. Toomey says that not one in a hundred of the growers in this valley prune their fig trees enough.

"What's the matter with the fig growers is that they do not prune enough. The suggestion ought to be made that they should do more of this in producing figs in this valley. Not one in a hundred of the growers prune anywhere near enough, and some of them actually do not prune their trees at all.

"Would pruning make any difference in the fruit? Certainly it would, and a big difference, too. The quality would be immensely improved. Fig trees need as much pruning as vines or any other plant, and should be pruned as conscientiously. This is certainly not done in the vast majority of cases.

"The result is inevitable. A great proportion of small goods, fit only for manufacturing, is produced. The percentage of one and two crown figs runs very high. The grower gets 1 and 1½ cents for his figs. Why? Because of the large proportion of the one and two crown goods which has to be put up in fifty pound boxes for $40 and $50, and has to be handled at a loss.

"The proportion of the small grades this season ran as high as 30 per cent or a little more, of the entire crop. This proportion should not be more than 5 per cent to 10 per cent, and in case the right sort of pruning were done might be 2 per cent or 3 per cent.

"And this would make a great difference in the fig situation, for everyone in the business."—Fresno Republican.

Bees and Their Care

STATE BEE KEEPERS' ASSOCIATION.

The State Bee Keepers' Association of California held its annual session in Los Angeles last Friday and Saturday. Nearly all sections of Southern California were represented but very few were present from the North. This association is made up of delegates from all sections of the state, but as the state is so large each of the larger honey producing communities has local organizations of its own. These organizations affiliate with this state organization. At this meeting methods of bee culture were discussed at some length but the interest centered more largely around the suggested changes in the present bee inspection law. Some of the large communities felt that the present law was sufficient and should not be tampered with. But Prof. Ralph E. Benton of the State University, who was present, showed plainly the defects in the old law and pointed out the advantages in the proposed new law which had been endorsed by several of the local associations. After threshing out this matter in committee all Saturday forenoon it was presented to the convention in the afternoon and required practically that entire session to bring out its good points so as to secure the support of the convention. The officers for the coming year were elected as follows: B. G. Burdick, Redlands, president; A. B. Shaffner, Los Angeles, secretary and treasurer; George Emerson, Santa Ana; M. H. Mendelson, Ventura, and L. L. Andrews, Corona, executive committee, and the following vice-presidents: Delos Wood, Santa Barbara; L. E. Mercer, Ventura; E. B. Fisher, Burbank; G. F. Merriman, Twin Oaks; Pearle Glass, Corona; J. K. Williamson, San Bernardino; J. M. George, El Centro; H. J. Brown, Tulare; Muth Rasmepen, Inyo; N. A. Peyal, Oakland; F. E. Brown, Hanford; J. C. Pleasants, Orange; J. C. McCubbin, Fresno; B. B. Honaborn, Elk Grove; J. Peterson, San Luis Obispo; Vern Townsend, Monterey; A. J. Brown, Bakersfield; S. Iselenstein, Stockton.

National Live Stock Association

The sessions of the American National Live Stock Growers' Association which closed last week in Los Angeles were every one of them filled with most intense interest from opening to closing. There was no waiting for committees to report or for speakers to appear on the program. Large attendance was given to every session and showed movement and the action of a class of people who were anxious to do things and break away. In fact it was a gathering characteristic of the people who made up the convention. As a rule the discussions were harmonious though on the last day some little friction developed over the endorsement of the Forestry Service and especially of endorsement of Gifford Pinchot at the head of the service. The sheep men and especially all stock men from Colorado were very strong in opposition to the Forestry Service. Resolutions which were introduced endorsing the Service were fought section by section as well as in a general way. But the Colorado men proved good quitters when they saw they were beaten, and full endorsement of the Forestry Service was given.

The warmest supporters of Mr. Pinchot admitted that mistakes had been made. The present plan of leasing the ranges to stockmen for a consideration has been in force but a short time. A vast number of employees have been required and some of these have been either incompetent or altogether too "chesty" to deal properly with people demanding fair treatment. But on the whole the management of the ranges is leading toward a more satisfactory solution of the range question.

A pretty fight developed between Fort Worth and Denver for the next place of meeting. The association was born in Denver and has held its sessions there many times. In fact, many stockmen maintain that it is such a central location that at least half the conventions should be held in that city, each alternate year being held in other cities to make the discusssions more general and attract membership from all portions of the country. Fort Worth put up a magnificent fight and her people were well organized, but Denver seemed to have the stronger pull and before the situation was fully realized Fort Worth magnanimously swung into line and suggested that she was willing to withdraw her invitation for next year and moved to make the election of Denver unanimous but insisted that her invitation should stand for 1911.

In the invitation to Fort Worth its delegates asserted that Denver was the center of the greatest stock section in the world, Kansas City, Omaha, and many other sections were in the packing business many years before the total stock handled by the city aggregated a million head. It was asserted that Fort Worth reached the million head mark within four years from the start of the industry around that city. A great reception is promised for the delegates when Fort Worth is reached.

One of the strong recommendations made in the resolution was that Congress enact a law which would prevent railroads changing rates except on the approval of the Interstate Commerce Commission and after notice to all parties interested. Another resolution was that a law should be enacted providing for a minimum speed limit in the transportation of live stock. Also that railroads be allowed to give free transportation to live stock attendants on stock trains both ways. Of course it goes without saying that a demand was made for the retention of the present tariff on hides. A strong recommendation was made that Congress should make sufficient appropriation to allow the Secretary of Agriculture to continue the work of eradication of the Texas fever tick. It was also recommended that all western states enact laws empowering sanitary boards to condemn, appraise and slaughter all animals infected or exposed to infection from fatally contagious diseases. The administration of President

NOW IS THE TIME TO PLANT

FRUIT TREES

If you want the best, well rooted, straight trees, true to name, ask HOWARD & SMITH, Nurseryman, Ninth and Olive Sts. Every order receives special attention—whether for one or a thousand trees. A complete assortment of deciduous and citrus trees, berries, grapes, etc. Send for special price list. Free delivery in Hollywood, Glendale, Pasadena, Eagle Rock and within city limits. Both phones. Mail address, Box 484, Los Angeles.

The stock of nursery navel orange trees of Orange county has been practically all cleaned out.

Roosevelt and Secretary Wilson was declared to be fair and as a rule satisfactory to the stock growing interests. The officers elected for the coming year were as follows, which is practically the same managing board as that of last year: President, H. A. Jastro, Bakersfield; first vice-president, Murdo Mackenzie, Trinidad, Colo.; second vice-president, Joseph M. Carey, Cheyenne, Wyo.; treasurer, Col. W. E. Hughes, Denver, Colo.; attorney, Sam H. Cowan, Fort Worth, Tex.; secretary, T. W. Tomlinson, Denver, Colo.

Nineteen states had delegates present and Pres. Jastro in his appointments of executive committee chose from one to six delegates from the different states to act on the executive committee for the coming year.

After the close of the business sessions, jaunts were taken to Pasadena, the beaches, the orange groves and other points of interest for several days.

BANK OFFICERS ELECTED.

At the annual meeting of The Savings and Loan Society of San Francisco, held January 26th, the following directors were elected: Geo. D. Greenwood, President, James J. Fagan, Vice-President, Horace Davis, W. B. Dunning, E. C. Burr, F. J. Carolan, A. N. Drown, Arthur A. Smith and Vanderlyn Stow. The Savings and Loan Society was the earliest incorporated savings bank in California. On account of its former location in Clay street it was for many years known as the Clay Street bank. During the 51 years it has been in business it has disbursed in dividends the grand total of $17,038,962.29. For the six months ending December 31, 1908 a dividend on deposits has been declared at the rate of 4 per cent per annum.—San Francisco Call.

SPRAYERS.

The H. L. Hurst Mfg. Co., of Canton, Ohio, manufacturers of Quality Sprayers and pioneers of "free trial without a cent in advance" as applied to sprayers, are now advertising their line in the Cultivator. They have three special styles among others which are of great value to fruit growers and farmers. The first is a "Fitz-All" Sprayer, the second the Man Power Potato and Orchard Combination Sprayer and third, a Horse Power Combination Orchard and Potato Sprayer. We shall not attempt to describe these machines as this company sends out a free catalogue describing them and other styles which they make. It is entitled "Needn't Send One Cent." It is handsomely printed and every fruit grower and gardener ought to have the catalogue, not only for the description of the machines but for the valuable spraying guide and formulas which are to be found in it. It also contains several pages of detailed explanation how any farmer, anywhere in the United States or Canada, can get a Hurst Sprayer on trial "without sending a cent in advance." It also explains how the first person in every locality can obtain a sprayer free. Mention this paper in writing.

GARDEN CALENDAR.

One of the most helpful garden calendars and catalogues we have seen is that issued by the Charles Winsel Co., of 251 S. Main St., Los Angeles. It is a book of nearly 90 pages and full of interest and information for the gardener from front to back cover.

The recent storm has proven very conclusively the damage done by the fires of last summer. Inspection has shown that the last dash of the storm cut many gullies and carried off practically all the surface soil of the burned areas.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

ON THE RANCH.

THE rain still comes down until it has become not a matter of what work we wanted to do next, but of working the land that is dry enough to be handled. The rule of plowing should be, never run the plows except when the land will crumble. If it remains wet and sticky it is very mischievous to run plows or harrows over it. Working sticky land is making it into brick when it drys out. Humus is needed in this class of land and when several crops of peas or burr clover have been turned under it takes away this gumbo character. It often pays well to plow in green alfalfa to bring the soil into prime condition. That looks extravagant with alfalfa at the present prices, but it will not stay at the present high prices long, for whenever any product is let take its natural course in selling prices, it regulates itself, by having everybody planting when prices are high, and nothing brings down the price so quickly as a large supply. I think we will see the acreage planted to alfalfa greater this year than it has been for some time past. I bought the alfalfa seed needed yesterday as I did not care to risk a rise in prices next month. We have some sprouting at present or rather put to sprouting to see how it will turn out. The home saved corn and sorghum seeds give us better crops than the seeds we can buy readily in the market. If we raised the alfalfa seed we use I believe we could have better crops.

Alfalfa Care.

Now is a good time to run the mower over the older alfalfa if the dryer portions are on top of the newer growth. Then the ditches should be repaired. As soon as the land is a little dryer the disks can be run to advantage. Where the stand is fully as strong as is desirable, then it will not need the splitting up of the crown, still it may be helped greatly if the soil is loosened with a spader or rangle harrow. One piece we are working on now with four Japs had become full of bermuda grass. After it had been plowed and crossed with the sharper disks the Japs use the four tyned hay forks to remove it. After a little time it is burned and again the cultivator run over the bermuda. It is cross cultivated to rake out all the remainder. Around the swale a slight check will be thrown and then the land will be plowed and planted to barley for a winter crop and followed in the spring by a sowing of sorghum, after the bermuda has received a second cultivating, raking and burning up. Keeping the land covered with a growing crop and, then, whenever it is plowed, raking and burning any bermuda that is found will in a few years end this troublesome pest.

Johnson Grass.

After plowing a piece of Johnson grass land the roots should be raked up and disposed of in some way. This year of high-priced feeds we have sacked and used them to increase the pigs' feed. They seem to thrive on Johnson grass roots when they do not have them to root out, nor as an exclusive diet. However they might not be good if continued too long. In the alfalfa fields Johnson grass is destroyed by the constant cuttings. As it never has a chance to mature any seed it fails to make more than surface roots.

Disking.

Where the alfalfa stand is light on a field it should be disked one way almost at once to kill out the foxtail. Later, when the danger of frost is past, then it should be sowed with fresh seed and disked in the cross direction. I often sow in a little barley when thickening up old alfalfa. I do not practically find it smothers out the alfalfa as many fear. When alfalfa seed is eighteen sents a pound, if ten to fifteen pounds is sown to the acre, with a light seeding of barley, say fifty pounds or less to the acre, the first crop resulting will be good hay, the barley having filled the place usually taken by the foxtail. Then the alfalfa plants will have room to grow large and make the roots as thick as a man's wrist. The next year's disking divides the alfalfa crowns into two or four pieces and a heavy stand has been secured at a less expense than where so much more seed is used. This is the reason why many people sow barley with their alfalfa. In making a success of this way of doing, the land must be worked well and deeply and then after a week's rest it should be cultivated deeply and the cultivation followed with the drill putting in the barley; then the alfalfa seed is sown broadcast over the surface and lightly harrowed into the earth. The seed bed cannot be too well made if success is to be secured in alfalfa growing.

How do we sow at the ranch? Well, the land for the alfalfa has been cleaned off and plowed up once and is taking in all this glorious soaking rain. As soon as we can do so, without injury to the land, it will be plowed again and then harrowed and left for a few days, then cultivated and harrowed until it is as smooth as the flower beds around the house. The small hand seeder is used for the alfalfa and the seed is put on twenty-five pounds to the acre, then harrowed lightly into the land. In ten days it shows up well all over the place, and after the fifteenth of March the frost is not likely to be severe enough to hurt anything that has passed the first leaves.

Manure.

Whenever, there is any manure to spare, there is no better place to put it than on the alfalfa fields. The use of gypsum in the stables does much to hold the nitrogen and if five or six loads of stable manure with a sack or two of gypsum to the acre goes out to the alfalfa fields every fall the crops can be made a third larger. The growth of the plants of a fertilized alfalfa field will be six to ten inches taller at each cutting, than in the tramped out neglected patches. The summing up of all this is, that if you want the largest tonnage possible,

then sow heavily without nurse crop and fertilize, cutting for hay and not pasturing the fields. The other way may be the cheaper. If the high price of labor is considered in cutting the crop to feed green to the cows, it may pay better to pasture the alfalfa. If this is the case a thinner stand of alfalfa with barley disked into it will make a heavy first crop of hay, useful for horses and cows. Then the fields may be pastured the rest of the season.—M. E. Sherman.

COUNTRY PORK PACKING.

The advantage to the farmer in packing his own pork and the financial gain in it also is spoken of at some length by a writer in the Farmers' Voice after which he gives points on home curing as follows:

Cutting It Up.

"From the time the carcass is hung on the hooks, the farmer must remember that to make the most profit he must not follow the usual farm methods employed, but, like the large packers, cater to the public taste. First, I cut the backbone out of the carcass just where it joins the ribs; then from each half trim off the hams and shoulders; from the sides remove the spare ribs and lay them aside to sell immediately. The parts are now divided as follows: The hams, bacons and shoulders, to be put down in salt. There are two strips or flitch, the backbone, the pig's feet, the spare ribs, and the head. From these will come the meat for sausage, the fat for lard, and the trimmings for special sale. People are glad to give 20 cents for a set of pig's feet, while spare ribs are a scarce article and are easily worth 35 cents a side. After trimming the sweetmeat off the backbone, the latter, when cut into sections, sells at 7 cents per pound. The cheeks and meat from the head make sausage, while the skull boiled is excellent for winter-laying hens. In making sausage, I cut the fat well out, so it will not be too greasy. Fat enough to fry is plenty. If posible get three pounds of beef loin or flank to mix with every twenty-five pounds of pork to modify the taste. After runnning the meat through a sausage grinder, season with salt and pepper and moderate with sage or some other spices. Sausage equals about a pound to the pint and if there is too much sausage for immediate sale, put it in a three- or five-gallon stone jar and run about two inches of melted lard over it. This will keep it sweet all winter if maintained at an even temperature. It need be opened only as enough is sold to empty a jar. After rendering the lard put into the stone jars and sell as the demand requires. Good country-made sausage readily brings 15 to 18 cents per pound. Lard about 14 to 16 cents per pound. I supply some of the best hotels with my lard and pork.

"After the hams and bacon have been smoked they will be ready for marketing about February. Last year country-cured hams were worth from 14 to 16 cents, bacon 18 to 20 cents, and shoulders 10 to 12 cents. There is no comparison of the commercially-cured products of the big packers in the same class with the home-cured meats, and when people once get the opportunity to buy country products they will always be patrons.

Financial Results.

"Now as to financial results. Take a hog weighing at home 200 pounds, on a basis of a 5 cent market live weight, its value is $10. It fat the hog loses about 20 per cent or forty pounds, leaving 160 pounds edible portion. Approximately, the dressing will be: Two hams, 30 pounds; two shoulders, 24 pounds; four strips of bacon, 28 pounds; spare ribs, head, feet, and backbone, 35 pounds, leaving about 45 pounds for sausage and lard. The meats to be smoked will increase about 10 per cent in weight in the pickle, but lose about the same in smoking, so the selling weight is the same as the dressing weight. The following are very conservative prices for a country-dressed hog: Thirty pounds ham, at 14 cents, $4.20; 28 pounds bacon, at 15 cents, $4.20; 24 pounds shoulders, at 9 cents, $2.16; 45 pounds lard or sausage, at 12½ cents, $5.60; 35 pounds backbone, spare ribs, etc, at 6 cents, $2.10; soap fat, about 25 cents; total, $18.51; cost of hog, $10; profit, $8.51. This is no mean profit on the small outlay required and gives the farmer good wages for the time taken. After the trimmings are sold, if in no need of cash, he can hold his sausage until markets are favorable and his smoked meats until summer, when they will command a good price."

Equipment for Such Work.

"In order to do this successfully, however, the farmer must install an equipment, which need not be costly. The more important matter is that he understand how to cut up the hog so that all the pieces will have a neat appearance. Furthermore, he must learn how to cure this pork, how to pack it, and how to handle it so that it will come to the buyer in as neat and appetizing form as that furnished by the packer. We have seen farmers bring into the store country cured hams in sacks that had contained clover seed, and in other sacks the outward appearance of which was anything but pleasant, and trimmed in a manner that suggested ignorance, carelessness, and clumsiness. There is as much in the outward appearance of a ham as in the attire of a man or woman.

"If the farmer is to build up a reputation for his country-cured pork he must kill nothing but well bred hogs and of a size and quality suited to the consumption of the well-to-do class of people. The hog should not be over 200 pounds. If he wishes to make a specialty of hams and bacon, it should be well bred and fed on a variety of feed. Corn alone makes too soft a fat that shrivels up in the pan. Any farmer, however, can grow them on alfalfa or clover. He can use skim-milk and buttermilk from the dairy. He can grow Canada peas for summer feeding. He can balance up his corn with oats, barley, wheat screenings, oil-meal tankage, and produce bacon and ham of which the well-to-do citizen, when he has once tried them, will want more of the same sort and will not hesitate on account of price.

"There has been so much adulteration of lard and sausage that the farmer who produces a first class article, puts it up in a neat and attractive shape, and puts his own brand on it, can get a fancy price whenever it is ready for the market. There should be no difficulty about the farmer getting $16 to $20 for every $10 hog that he kills; and it may be well to ask whether there is not as much profit in killing the hogs and putting them on the market to a limited extent as there is in growing them in the first place.

The tree commission of Redlands is doing active work in tree planting and care along the roadsides.

FEEDING MILCH COWS.

Milch cows require different feed from beef cattle. You should not feed much fat forming foods, as your cows would lay on fat instead of producing milk. Feed more silage or roots in the winter.

Daily feed for a thousand-pound cow: 40 pounds of silage, 7 pounds clover hay, 8 pounds of grain. The cows that are soon to freshen should be fed on succulent feed, such as silage or roots, bran, linseed meal with a little oats. Keep the bowels open and do not feed very heavy on grain just before or after calving.

After calving, give bran mashes and warm the drinking water for a few days. Allow the calf to suck for about two days, and then feed the mother's milk from a pail for about two weeks, about three quarts twice a day; after that reduce it with skim milk or warm water so that at the end of the fourth week the calf will be getting all skim milk or half whole milk and half warm water, with some reliable stock tonic to aid digestion. Keep a supply of good clover or alfalfa hay within reach and also some ground oats, with a little linseed meal mixed with it.

After the calf eats the ground feed, gradually get him used to eating whole oats, as this is the best feed for him up to six months old.

The heifers should not be bred until fifteen or eighteen months old.—By Dr. David Roberts, Wisconsin State

A GREAT GUERNSEY RECORD.

Last March, the two-year-old Guernsey heifer, Dolly Dimple 19144, Adv. R. 628, finished a year's official record of 14009.13 lbs. milk, 703.36 lbs. butter fat, which would be equivalent to 820 lbs. butter. This is undoubtedly the most remarkable year's official record in the world, when age of animal is considered.

Oct. 9, 1908, this remarkable heifer dropped her second calf. During the last 15 days of the month, she gave 927.1 lbs. milk, which contained 41.63 lbs. butter fat. During the month of November, she gave 1898.6 lbs. milk, which tested 4.49 per cent, and thus contained 85.25 lbs. butter fat.

She recently gave a seven day test of 444.8 lbs. of milk which tested 22.03 lbs. butter fat.

Statement of feed given during the week: Hay, 70 lbs.; Silage, 105 lbs.; Roots, 140 lbs.; Beet Pulp, 63 lbs.; Bran, 126 lbs.; Pea Meal, 8.4 lbs.; Ajax, 8.4 lbs.; Ground Oats, 12.6 lbs.; Gluten, 12.6 lbs.; Oil Meal, 8.4 lbs.; Alfalfa Meal, 8.4 lbs.; Cotton Seed Meal, 8.4 lbs.; Hominy, 4.2 lbs.

It is doubtful if there is a better 7 day record for an animal of same age and on equal feed of any breed in the world.

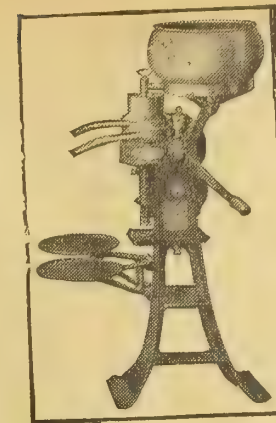
THE EMPIRE CATALOGUE.

The new 1909 catalogue put out by the Empire Cream Separator Co., whose ad appears in this issue, is now ready for mailing. It is replete with information for the cow owner. The cuts are excellent, and the line is so complete that any rancher can choose a machine to suit his herd of from one to one hundred cows, or to suit his pocketbook. Every man or woman who is interested in cream separators should send their address at once for one of these catalogues; it is worth reading.

The company is progressive and their phenomenal growth in the last ten years demonstrates how popular their machine must be. They claim their sales now are fifty times as great as eight years ago. They have kept experts at work for years making a study of just what would make the best all-around separator for the rancher to wear out. The result you can see by reading their catalogue or examining their machine. After the machines have been assembled and the bowls carefully balanced and made to run perfectly true, they are run several hours with water to test each machine before they are sent out to be placed on the market.

The company has branches all over the United States and Canada, with the Pacific Coast branch located at Portland, Oregon. This branch carries a large stock of machines at San Francisco, Spokane, Wash., Helena, Mont., Idaho Falls, Idaho, and Vancouver, B. C. This saves the purchaser from paying a large amount of freight, as he is able to get the machines right near home.

It is also introducing two small sizes of gasoline engines, which are becoming very popular owing to their simplicity and general make-up. You should read their catalogue.



The Simplest, Strongest And Most Convincing Of Cream Separator Arguments

We cannot believe that there is a sensible man living who would put his own money into the purchase of any other than a DE LAVAL cream separator, for his own use, if he would but first avail of the opportunity open to everyone to see and try an improved DE LAVAL machine before buying any other.

It is hardly possible to say more than this. It is hardly possible to put the simple truth in plainer words. It would hardly seem possible to say it more convincingly.

The trial of a DE LAVAL machine is free to every responsible man thinking of buying a cream separator. We have agents in every locality for this purpose. If you don't know the agent in your neighborhood send to us for his name and address and it will be a pleasure to give your inquiry prompt attention.

A PROFIT OF $490.00.

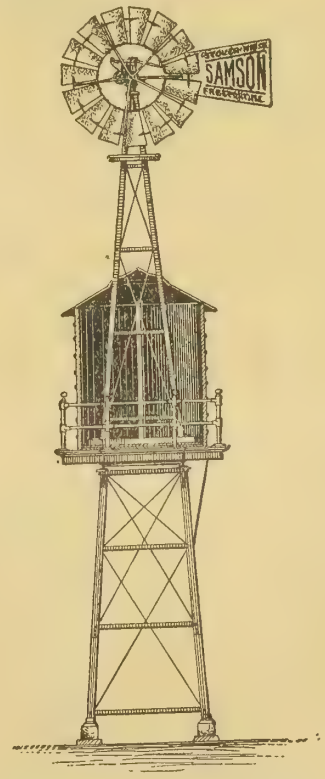
J. Dickerson, Fort Wayne, Ind., writes January 5th, 1909, as follows: "I am using Absorbine on my pacer and it is worth its weight in gold. I bought him in July, after he got hurt in a race, for a $10.00 bill, and am now offered $500.00 for him at any time." Lameness, bruises, strains, swellings or inflammation in the muscles or joints respond quickly to Absorbine, $2.00 a bottle at druggists, or sent postpaid on receipt of price. W. F. Young, P. D. F., 244 Monmouth St., Springfield, Mass.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

Wood soled Boots and Shoes. Boots $3.25; Shoes, $2.00 O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Citrus Markets, 142, 143.

IT RAINED.

"The biggest January ever" from a rain standpoint is the verdict for 1909. So great in fact was the downpour that vast damage has been done in some sections. This is especially true in lowlands protected by levees where the water could not be disposed of rapidly enough without flooding of much valuable land. This will greatly reduce the output of some of the richest lands of the state this year and in this sense is a serious loss. On the whole, however, the benefits will be so much greater than any possible loss and a feeling of assurance in California conditions increased so that as a whole, happiness is having full sway over the state.

SUNKIST.

The Southern California Fruit Growers' Exchange is again taking up a campaign in eastern papers, of advertising its fruits. The advisability of this was proved out to the satisfaction of the management and that it was a money winner in last year's campaign in Iowa. We believe that a very wise move and believe that the money invested that way will return several fold to the orange growers.

Another feature we note is the adoption of the catchphrase "Sunkist" oranges and lemons of California. Now, freak spelling, at times, brings forth very catchy phrases that stick to people's minds longer than the orthodox way of doing things, but like the proverbial "Sublime and ridiculous," there is slight latitude in it. Sunkissed, spelled out, would we believe, be far more attractive than "Sunk-ist." That surely is the division that may be made in the minds of some, and it would not add to the attractiveness of any fruit, the description of which is pronounced that way.

We think it is an opportunity for subscribers of the Cultivator to send in suggestions for catchy phrases which would prove of great value to the advertising committee of the citrus people.

We recall very well, a few years ago when Mr. Roeding wished a catchy name or brand to establish for his figs, an advertisment in this paper brought forth the suggestion of combination of the word, California and of Smyrna from which country the fig came. The combination resulted in "Calimyrna," a most euphonious and attractive looking word, and it has proved a winner. Sunkist may, but it doesn't look good to us.

TARIFF REDUCTIONS.

Reports from Washington do not reassure fruit growers of California, especially since the promise comes that a material reduction will be made in the tariff on grapes, oranges, lemons, hops and olive products. Secrecy has been pledged on the part of the committee but it is understood that these have been selected for the slaughter. Rumor has it that the reduction is only 10 per cent, but this, especially on lemons, it is feared by many will bring disaster. Sure it is the industry is handicapped enough now by freight rate necessary to get our products to Eastern markets, and for Congress to increase this handicap shows lack of consideration for the welfare of the producing classes. However, it must be admitted that the cry has been for tariff reduction and it has been claimed that California had nothing which she would concede, consequently the issue had to be forced on some lines. The Eastern manufacturers felt they had some justice in demanding that they should not carry the burden of all the reductions.

THE WOOD LOT.

We recently noted in an eastern paper this remark: "When you are thinking of buying a farm look for plenty of wood for fuel and other purposes, for good water, good neighbors and good market advantages."

It may not look at first thought as if that part referring to the "wood for fuel" would apply to California conditions. The "woodlot" has not been a factor on the California ranch as a rule. This year has seen such a movement towards planting of wood and lumber trees that it is very probable future California farms may occasionally show a profitable wood lot which will aid in the fuel and lumber supply of the farm, and in addition we believe add to its saleability in case addition we believe add to its salability in case the fence or the corral, and even timbers for the construction of our homes may just as well be grown on many ranches as to buy them all from British Columbia. It would probably not be advisable to grow them on $1000 per acre land, but there are acres on many of our farms which have land not valued that high and of but little use for other purposes. Such lands should be utilized for the wood lot.

CO-OPERATE.

A number of growers of rhubarb gathered in the office of the Cultivator this week and discussed the question of disposing of the products of the members. Some exceedingly profitable returns have been received by growers of rhubarb. Again at times and with increasing regularity disastrous returns have been the results of shipments of fine stock. The growers in question knowing the worth of the article which they are producing and the favor which it has secured wherever introduced and delivered to consumers in a fairly fresh condition, propose to secure the further introduction of this product and do it in a way which will return a due share of profits to the grower as well as to the commission men.

No definite line of action has been taken as yet other than to call for a more general meeting next week. At that time it is possible the organization may be completed. Sure it is that such a product is worthy of being pushed and the pioneers in the industry deserve such help as may be given, and co-operation will give that help more effectually than any other plan.

LINCOLN.

All the world is turning at this time to thoughts of America's most loved president. Somewhat crude in the eyes of the polished people of his time, but so honest and sturdy and fearless in the carrying out of his convictions that the world has never ceased to voice its admiration. This is expressed more and more as the years show the greatness of this great man's acts always performed humbly and with no self-assertion. This year in particular, attention is attracted from the fact that it is the centenary of his birth. This occurs next week, February 12, and too great praise cannot be given to the emancipator of slaves and savior of his country.

BE UP TO DATE.

The way-back farmer remarked as he watched the introduction of gasoline power on his neighbor's farm: "Isn't it strange how men will scheme to get out of honest work?" Such farmers as this are the kind who accomplish their work by "main strength and awkwardness," not thinking for a moment that the more energetic and up-to-date farmer who uses gasoline or electrical power to do the dirty and heavy work of the ranch and applies his activities along other and more important lines is the least lazy of the two.

Be up to date and keep the engine busy.

NUT GROWERS ASSOCIATION.

National Nut Growers Association has taken up the matter of forming a branch association in the state of California. The matter has been brought to the attention of the association at Santa Barbara and it is hoped the organization can be completed for it is believed that much good would result from the formation of an alliance among the producers of nuts in California, which in 1907 produced 12,000,000 pounds of walnuts and 2,000,000 pounds of almonds, and that organization would be simply in line with the tendency of the other horticultural and agricultural interests of the State.

Many of our readers can often avoid the loss of time, which is the most valuable asset we possess, and some cash, just by giving a little attention to the methods employed by our best ranchers, stock raisers and fruit growers. We are communicating regularly with that class of farmers as well as with the different agricultural colleges throughout California. Every issue of the Cultivator contains knowledge which, if put in practice, will prove helpful to any person interested in farm work. Farmers from the East, even though they have had long experience and success, will find the "same old way" will not, in all cases, apply here, and therefore the little time you give to reading the Cultivator will often prove a wise investment.

The number of sheep in the United States increased during the year 1908, from 54,631,000, which was the number, according to the Department of Agriculture, on January 1, 1908, to 56,084,000 January 1, 1909. The average valuation, however, decreased slightly this year, being $3.43, as against $3.88 last year. This makes the total valuation of last year higher than that of this. The average valuation, however, is far above the average for the last ten years, which is only $2.92.

On January 1st, there were in the United States, 20,640,000 horses with an average valuation per head of $95.64, or a total valuation of almost two billions of dollars. This was an increase of over a half a million on the figures of January 1, 1908. The same statistics, which are furnished by the Department of Agriculture, show the number of mules to be 4,053,000, with an average valuation of $107.84, showing the mules to be worth about $12.00 more on an average per head than horses.

Agricultural Notes of the Pacific Coast

Northern California

Orange raisers at Healdsburg are concerned over youngsters stealing their fruit.

The first asparagus shipped this season is claimed by Rio Vista, Solano county.

It is estimated that there are $100,000,000 invested in the grape industry of California.

Many valuable bridges have been either damaged or washed out over the Sacramento valley.

O. E. Bremner of the State Horticultural Commission is recovering from an attack of typhoid fever.

The precipitation for the month of January over the Sacramento valley varies from five to 15 inches.

It is expected that the pack of peas at the cannery at Haywards will be greatly increased the coming season.

Fifteen thousand dollars is to be secured from the State Legislature if possible for dredging Petaluma Channel.

Hop growers of the entire northern part of the state are demanding a continuance of the present duty on hops.

The blackberry growers association at Sebastopol have settled with the canners for their last year delivery at $37.50 per ton. The association marketed 425 tons of berries.

Forbestown, Butte county, holds the record for heavy rainfall, the month of January showing a total of 50.35 inches. Three consecutive days showed an average precipitation of 6.50 inches.

At a recent meeting of the grange at Glen Ellen, Sonoma county, a resolution was adopted favoring an amendment to the Cartwright anti-trust law, making combinations of fruit growers possible.

The fight is waxing stronger every day between the people of San Francisco who wish the waters of the Hetch-Hetchy and those who wish to see the beauty of the Sierra Nevada mountains preserved.

The Haywards Poultry Producers Association is one of the strongest organizations of its kind in the state, the members being thoroughly united and working for securing better returns for their products.

Nevada county is engaged at this time in marketing oranges and olives in the western part of the county and in harvesting the biggest crop of natural ice in the eastern part of the county which it has ever had.

Steps are being taken to reclaim a large body of land adjoining district No. 70 in Colusa county. A mammoth system of levees or canals will be built and when the land is reclaimed it will be sold in small parcels.

Senator Rush has introduced a bill into the State Senate which calls for the establishment of a subordinate office to that of State Veterinarian which shall have charge of examination of live stock introduced into the state.

A bill will be introduced into the State Legislature providing for perpetual appropriation for the experiment station to be used on work along the line formerly followed by the State Viticultural Commission. The appropriation is to be for $15,000.

Central California

Turlock has the record for picking January grapes.

The acreage of alfalfa at Turlock is increasing at a rapid rate.

Recent abundant rains have caused a lowering in the price of hay.

The Sierra Nevadas are covered with snow even to the lower foothills.

California Canners Association has made an appeal for lower duty on tin plate.

The larger sizes of prunes are reported exceptionally scarce in the market.

Entire Sierra Nevada range is white from one end of the state to the other.

First new potatoes of the year at Hanford were marketed in January from seed planted in November.

Local butchers at San Jose report beef cattle scarcer and price higher than at any time for years.

The recent rain gave to Bakersfield about five inches of precipitation which is the greatest since '93.

The Turlock fruit juice factory is a bee-hive of industry at this time bottling the grape juice of the last season.

Of course the rain which has visited the entire coast has been "made" by "Rainmaker" Hatfield at Crow's Landing.

At a recent meeting of the Del Rey Farmers Union, J. T. Walton was elected president and Ben Swansen secretary.

Porterville has a twelve pound cabbage which the Messenger says is as big as a washtub and solid as a politician's cheek.

The wine makers of California are insisting that California wines shall enter Cuba on the same basis as Spanish wines.

It is reported that the raisin packers are keeping close watch on the Farmers Union, which proposes to handle the raisin output.

Porterville is contemplating the forming a levee and drainage district for the better protecting of the city in time of storm.

Students of Stanford University are working for the establishment of a school of Forestry in connection with that great institution.

Directors of the Turlock Irrigation District recently held an important session, at which report was made of survey for a high line ditch which will bring water to additional lands.

The Special University Extension Train, or Farmers Institute on Wheels is now making its fourth trip in the state through the San Joaquin valley.

The great May Day fete which is planned for Los Gatos is meeting with support by all surrounding communities, and a great day is promised for the flower festival.

A Sanger raisin grower investigating market conditions in retail sections of the east has found raisins selling at a high price and retailers maintaining that they are unable to buy the goods at a reasonable price.

Fresno raisin representatives before the Ways and Means Committee in Washington have shown very conclusively that the Zante currant which importers claim is a currant is nothing more nor less than a small duct.

Southern California

The Coachella citrus orchards will be greatly extended during the spring plantings.

Several new wells are being sunk in the Coachella valley by the Coachella Development Company.

Imperial valley is indulging in the novelty of making midwinter cuttings of alfalfa and making good hay from it.

The ice plant at Coachella which has been out of commission for some months will start again in a short time.

Coachella Valley is objecting to the vast number of quail and appeals to hunters to help them decrease the number.

A new fruit company has been organized at Redlands under the name of the Denman Fruit Company with $20,000 stock.

Redlands orange growers maintain that their returns up to this date have been better than those of last year, same date.

The rainy weather stopped the packing houses for a time, but they are now rapidly resuming operations in all citrus sections.

Much new land will be brought under cultivation, some planted to orange trees, in the southern part of the Riverside section.

Riverside citrus growers are considering the formation of an organization to fight insect pests and protect against further inroad.

A strong advance in the cabbage market of the east is pleasing to the cabbage growers of Coachella valley who are growing a fine crop.

Bell peppers are bringing to the gardeners of Orange county the biggest prices in years. The planting of young plants will be greatly extended this season.

Forty-seven walnut growers of Orange have formed a new walnut association. The president for the first year is R. M. Hargraves; secretary, H. G. Munhall.

The celery growers of Orange county are pleased over the faster train service with their celery shipments. Celery now lands in New York in ten or eleven days as against 14 formerly.

The restoration of entry of the government lands in Imperial valley offers no opening for speculation in lands. It is said that it means only that reclaimers of land may proceed to perfect title.

Farmers from other sections of Southern California who went last year to Imperial to plant melons, shake their heads sadly and say they will cultivate more staple crops this year.

The rain of last week covered the entire state and gave to Southern California the heaviest soaking it has had this year. The rain varied in quantity from half an inch to five or six inches, according to section.

The rhubarb growers of Southern California will meet next Wednesday, Feb. 11, at the office of J. W. Beasley, 357 Central Avenue, Los Angeles, to discuss plan of organization so as to secure better returns for their pro-

The Coast

Butter is quoted at Spokane at 37½ cents.

Owing to heavy snow near Lewiston, Idaho, some stock is starving.

The Hood River, Oregon, section is increasing its cold storage capacity.

Reservation of mountain forests of Hawaii is being made by the Forestry Service.

Large tracts of land will be planted to orchards about Vale, Oregon, this season.

Almond growing is receiving some attention along the Columbia River in Washington.

The grange at Lynch, Oregon, favors the construction of roadways by convict labor.

Arizona Orange Association has shipped nearly 50 car loads of oranges up to this time.

One creamery at Tillamook, Oregon, received 2,754,000 pounds of milk during the past year.

Over a thousand wool men gathered at the recent Wool Growers Convention at Pocatello, Idaho.

Fruit growers of Grand Valley, Oregon, received over $350,000 for their output of fruits this year.

The Lewiston Clarkson canneries report at the closing of the year a most successful run on fruits.

Two bills have been introduced before the Washington legislature calling for a reduction in the price of jute bags.

It is claimed there is more stealing of horses in Oregon, especially the western section, than ever before in its history.

A bill has been introduced to the National Legislature extending the provisions of the Carey Act to New Mexico and Arizona.

A part of the first walnut tree planted on the Pacific coast will be exhibited at the A. Y. P. Exposition at Seattle next summer.

Some cars of Arizona oranges netted after the payment of freight and commissions over $1250.

The sheep men in the National Wool Growers Association introduced strong resolutions opposing the forest policy adopted by the Forestry Service.

The Roseburg, Oregon, Fruit Growers' Association is sending a lobby to the state legislature urging the passage of bills favorable to fruit growers.

R. E. Cundiff of Riverside reports the Salt River Valley of Arizona as being exceptionally favorably situated for the production of early oranges.

Spokane has endeavored to secure an appropriation from the National Congress for aiding the National Irrigation Congress which is to convene there next August.

The Inland Empire Poultry and Pet Stock Association held their successful annual show at Spokane last week. It is announced that over 2000 entries were made.

Milton, Oregon, fruit growers have found from experiments tried last summer that great profit is secured from expending money in more careful packing of apples.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

WALTER HOGAN SYSTEM.

The Poultry Breeders of Southern California were entertained by no less a personage than Walter Hogan himself at their last meeting, held Thursday, Jan. 28, at Los Angeles. A large attendance gathered from surrounding suburban towns in honor of the event, and after a discussion about the best manner of marketing eggs and poultry, and different people giving varying experiences, showing how the larger producers contrive to control the prices, to the great embarrassment of the people who only have a few birds now and then, to sell, our genial President, L. R. Walton, introduced the speaker we had all come to hear.

Walter Hogan is an oldish man, and claims he discovered the great secret of not only selecting the 200-egg type of hen, but the secret of what cock bird will reproduce his kind. Now, if this can be proven true, the millenium of poultry keeping would surely be here. But there are many doubting Thomases who want to be shown, and Mr. Hogan lives in Petaluma, and has no birds here to back up his assertions. Furthermore, he says the 200-egg hen will not reproduce herself in the next generation, and that to breed to this type alone, is to degenerate one's flock back to primitive jungle fowls which only lay in spring and not much then. Therefore, very few decided to pay the $10.00 he demanded for teaching this great secret, although some who have taken it, declare they think it worth all it cost them.

There is another system, very much like his own, which can be bought for $1.00, and the genuine Walter Hogan system has been advertised all over the East for $2.00, but perhaps a personal showing by the originator would be forth the added expense over the book. Every one buying the book or taking the lesson is sworn to secrecy, that the man who discovered the secret may reap some reward for his years of toil and study. He did offer to take a class of 100 at $5.00 each, but refused to consider a class of 50 at that price.

I may be a doubting Thomas myself, but think these systems mostly useful in detecting the present layers in a flock, thus preventing the slaughter of a laying hen, for market purposes, as a hen's shape changes materially when her clutch is laid out. Compare a broody hen with a laying one, and one can soon tell "which from 'tother."

I have studied both these systems from the published books, (the Potter and the Hogan) and those who have taken the personal lesson say they always refer to the book, not trusting to memory, so those who have missed the lesson direct, may still try the book, if interested.

The discussion about the marketing of fowls and eggs interested me principally and an expert is to address the meeting next month on the subject of marketing fresh eggs. Those present believed a guarantee as to the freshness of eggs should be provided by the producer, and his trade depend upon his living up to his guarantee. The dealers were suspected of favoring the cold storage plants instead of the rancher, by more than one, and those who sold direct to customers reported the best results. No difficulty is said to be experienced in getting from 5 to 10 cents above market quotations for reliable home grown eggs, but the trouble is to obtain a steady supply of one's own eggs to keep customers the year around. Then the large dealer steps in and says "Buy of me altogether or not at all" and the dealer must get where he can depend upon a constant supply. The same complaint is made in regard to squabs and broilers; Mrs. Burbridge reported that she could get from 30 to 40 cents a pound for all the broilers she could get, if a constant supply was assured, but a dozen or two now and then would have to go begging a buyer.

A large broiler plant is being considered, but several believe that the hotel people have gotten the "cold storage habit" and will not be turned from their present course, even should a supply of fresh poultry be assured. One man cited a hotel in a neighboring town, which charges the highest rates, and does not buy broilers of anyone he knows, so he believed they surely must use the cold storage stock. These matters are of public concern, and the proper officers should look into the matter, although perhaps the cold storage birds may be of first-class quality.

I used to know a young man who became head baker in a large Chicago bakery. He told me the eggs were carefully graded, and that the best eggs, (though all were seconds) were used in the white cakes, and the next grade, which he said were such as I would throw away pretty quickly, were used in sponge cakes and the

like while really stale eggs went into the spiced cakes.

I have not enjoyed bakers' goods so well since then. Our own baker never bought any eggs of ranchers, when we were living in a different town from this, although I tried to sell him some several times. He said he "could get them so much cheaper at the cold storage," seconds, "but all right for baking with."

Hail the day of water glassed egg packages, say I, put up on the ranch where they are laid, and marked with the date upon which they are packed. —Mrs. Frank Metcalf.

SQUAB RAISING.

The Connecticut Experiment Station has issued a bulletin on Squab Producing which has many points of interest. For several years the station has possessed pigeon lofts and has studied experimentally various questions connected with squab raising under conditions similar to those of individuals attempting squab raising for market. On the basis of experience gained and data recorded various questions concerned with the feeding, care, mating, management, and housing of pigeons, the killing and marketing of squabs, and similar topics are discussed.

Pigeons, the author notes, depreciate in value with age and are considered to be in their prime when 3 years old. Very few pairs "pay for their feed after they are 7 years old."

"There are many varieties of pigeons that are used for squab producers, but probably the most common is the Homer. These are very vigorous birds, and there are few breeders who do not consider a certain amount of Homer blood essential. They are often crossed with Runts, Duchesses, or Dragoons. The Runt is a very heavy bird, but in most cases is considered a little slow in productiveness, while the Duchesse gives a feathered-leg squab, but has a tendency to increase the weight.

"A pair of young pigeons will seldom produce their first squabs in less than 8 months, and 2 pairs are about all they will produce before they are 1 year old. The first pair, as a rule, are small and are generally sold as culls. Five pairs of squabs a year are about all that a good flock of pigeons will average per pair, and there are many flocks that are doing less than that, while a few are doing more. It is seldom that a pair of pigeons are found that will produce over 7 pairs in a year.

Data giving the results obtained from 14 individual pairs in a loft of crosses show that the total number of squabs raised per year ranged from 4 to 17, the average days required for maturing squab from 21 to 29, and the average weight of the squabs from 8.75 to 13 oz. each.

A pair of squabs, whose weight is recorded in detail, weighed when 2 days old 1 oz. each and when matured at 26 days 14 and 16 oz., respectively. Data are also given showing the daily weight of the first squabs raised by 6 pairs of Homers, together with the age of the breeders.

The advantages of proper mating are shown by the fact that the average number of squabs per pair thus mated was 4 the first year and 5 the second year; the cost of feed for each pair of breeders in the 2 years, $1.27 and $1.33, respectively, and the average returns for each pair of breeders for the 2 years, $2.06 and $2.66. With pigeons carelessly mated the aver-

Made of wire that is all life and strength — wire that stretches true and tight and yields just enough under impact to give back every jolt and jam it receives.

Made of materials selected and tested in all the stages from our own mines, through our own blast furnaces and rolling and wire mills, to the finished product. Our employment of specially adapted metals is of great importance in fence wire; a wire that must be hard yet not brittle; stiff and springy yet flexible enough for splicing—best and most durable fence material on earth.

To obtain these and in addition apply a quality of galvanizing that will effectually protect against weather conditions, is a triumph of the wiremaker's art.

These are combined in the American and Ellwood fences—the product of the greatest mines, steel producing plants and wire mills in the world. And with these good facilities and the old and skilled employes back of them, we maintain the highest standard of excellence possible for human skill and ingenuity to produce.

Dealers everywhere, carrying styles adapted to every purpose. See them.

West Coast Chick Feed

Read what others say:

SAMUEL R. KELLAM, former president of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used."

MRS. A. BASLEY, the celebrated poultry authority, says. "I want some more of your West Coast Chick Feed, for it is excellent. It is purer, cleaner and appears better balanced than other feed I had been using, and to tell the truth, I have been experimenting, feeding both together, and they always eat yours in preference."

S. M. BUTLER, Lamanda Park, California, the well-known judge and successful breeder, says: "I want to say that too much praise can't be given West Coast Chick Feed for growing chicks."

See what your neighbors say, for there is more of "West Coast" sold in Southern California than all other kinds put together. If not sold by your dealer send us $3.50 and we will send a 100 lb. sack, freight prepaid within 300 miles.

age number of squabs per pair in the 2 years was 2.5 and 3; the cost of feed per year for each pair of breeders $1.20 and $1.21, and the average return for each pair of breeders, $1.11 and $1.41.

"In order to avoid dark-skinned squabs it is advisable not to breed from birds that have very dark legs or beaks.

"Often it is necessary to remate birds in order to secure stock suitable for market. Certain pairs will produce dark-skinned birds, while if they are remated it is quite possible to get a much better quality of squab. This is also done where crosses from different varieties of pigeons are being tried, and where some peculiar defect in size or shape may be noticed in squabs from certain pairs."

As regards feeding pigeons, "different methods of feeding have been tried at this station, also different kinds of feed, but the most satisfactory has been a mixture of equal parts of cracked corn, hard wheat, Kaffir corn and Canada peas, with the addition of a little hemp and millet seed during the molting season. Flat troughs about 5 inches wide and 2 inches high were used, and somewhat more grain than the birds required for a meal was put in, as we liked to have a little in the trough that they could have access to all times.

"There is nothing that will so retard the growth of a squab as to feed it at irregular intervals. This can be overcome by feeding the old birds regularly. We fed twice daily, about 7:30 in the morning and 4:30 in the afternoon. Another very satisfactory method was to feed a mixture of equal quantities of wheat, Kaffir corn, and peas from a trough, giving the birds just what they would eat up clean in about half an hour, and leaving a hopper of good cracked corn before them all the time. There is not much gained by changing the feed according to the season, as has often been advocated, although we do add a little extra cracked corn during the cold months. There is no more expensive attempt at economy than in trying to save by not giving the pigeon her full allowance of peas, although this is a high-priced grain."

Some data are recorded regarding the comparative merits of cheap and more expensive grains for pigeon raising. When 50 pairs were fed for a year a cheap mixture of grains (cracked corn, poor quality wheat, rape, millet, peas, and Kaffir corn) the average cost of feed for each pair of breeders was $1.03, the average number of squabs produced per pair of breeders 4.5, and the average value of the squabs per each pair of

breeders $2.10. There was an estimated net loss on the lot of $4.28, not including labor. When a more satisfactory grain mixture made up of whole corn, wheat, Kaffir corn, Canada peas, and millet was fed to 12 pairs, the average number of squabs per pair was 5.5, the average cost of feed for each pair of breeders $1.96, the value of the squabs for each pair of breeders $3.13, and the calculated total profit for the lot, not including labor, $6.05.

TURKEY EXPERIENCE.

I read with much interest Mrs. Hammon's method of feeding her young turkeys which is very similar to mine. You asked me some time ago to tell my way and am indeed glad to do so.

I do not feed for the first 24 hours, then I give them hard-boiled egg ground fine, shell and all. This I feed with onion top and lettuce chopped and mixed with it four times a day for about a week, then I feed a corn-bread made with just sour milk and a little soda and cornmeal. The second week I mix some corn-bread with the egg, onion tops and lettuce and feed four times a day. Then the third week I omit the egg and give them cottage cheese beside the corn bread and greens. I found great difficulty in getting them to eat grain, but by mixing it with the cheese they gradually came to it. After the third week I varied their meal by giving them Kaffir corn or wheat once a day till they got used to it. After six or eight weeks I fed them barley soaked over night and bran mixed with cooked vegetables and skimmed milk or sour milk to drink, besides their water of course. I feed just what they will eat up clean at a time and never leave any food by them. One important point I think is not to let them out foggy mornings as they will get wet, and to keep everything clean. I always have grit before them.

I wish to express my thanks to the Cultivator for the interest they took in answering my questions regarding turkey houses, etc., which has been very valuable to me as I had just young turkeys having bought all the eggs I hatched from last year, and I would have used the young turkey eggs and probably would have had weak turkeys. As it is now, I have sold all my turkeys, and with some of the money will buy three old hens to breed from and keep the Tom I got a while ago to go with them. Then I will have a nice start and a safe one. When do you think is the best time to hatch turkeys. There seems to be quite a difference in opinion; some say early in winter, and others late.—Mrs. R. E. Whitmore, Chino.

Farmers at Jennings Lodge, Oregon, are appealing to the legislature for the removal of the bounty on crows, claiming they are an advantage rather than a detriment to agriculture.

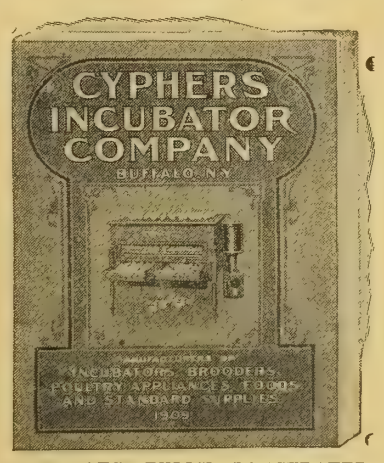
"WHAT THE POULTRY BUSINESS IS."

Five interesting chapters on poultry raising will be found in the new free annual book of Cyphers Incubator Company, Buffalo, N. Y. They cover the subjects of Feeding Chickens; Laying Records; Incubating, Brooding; and "What the Poultry Business Is." Both beginners and experts will get from these chapters valuable information they do not now possess—and one cannot know too much in and about the poultry business.

This great annual book has this year excelled all previous years in the attractive pictures it contains. Superior standard-bred farm fowls are



212 PAGES—FULLY ILLUSTRATED.

portrayed, as well as numerous prize winners at America's big shows. There are also photographs of the highest priced birds ever sold, and letters from their owners. These pictures include the five fowls sold to Madame Paderewski for $7,500.

Write today for this book. It will not cost you a cent, even for postage. Simply mail your name and address to one of the Branches of the Company (the one nearest to you) ask for the Big Book and mention the name of this paper. Address Cyphers Incubator Co., Buffalo, N. Y.; Boston, Mass.; New York City; Chicago, Ill.; Kansas City, or Oakland, Cal.

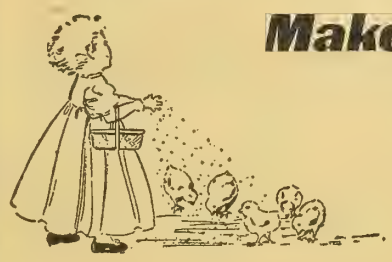
2000 EGG INCUBATOR.

Much attention is being attracted by the large incubators which the San Jose Hatchery is constructing and using here in San Jose. Each has a capacity of 2000 eggs, and is fourteen feet long by four and one-half wide. They are made after plans of inventor who has been using them with greatest success for several years. Gas is used for heating hot air tank which is inside machine. The ventilation is a special feature and is much different from that found in ordinary makes of incubators.

The manager of the hatchery, Mr. Henry Langenschwadt who operates the machines, says there is much in the kind of incubator you have to hatch your chicks, but after all a great part of success in hatching depends upon skill of man running the machine. Mr. Langenschwadt is a practical and experienced poultryman. Before he took charge of the San Jose Hatchery last fall, he spent over six months visiting poultry centers from California to Maine and made a general investigation of poultry industry.

Transformed Carbonate of Lime, the chief element of bone, is most cheaply obtained from granulated Hard Eastern Oyster Shell. Croley's Hard Eastern Oyster Shell is composed almost entirely of semi-organic carbonate of lime, easily digested and quickly assimilated by the system of the fowl. Young and growing chicks are just as much in need of carbonate of lime to make bone and feathers as the mature fowl for the prolific production of eggs. For these reasons it would be wise to insist on having Croley's Hard Eastern Oyster Shell to obtain best results.—Adv.

Coulson's Special Dry Chick Food



Makes Them Grow

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

General Agriculture

ALFALFA.

Farmers' Bulletin No. 339, entitled "Alfalfa," was recently issued by the United States Department of Agriculture. This bulletin contains a brief resume of the history and spread of alfalfa, which is followed with a rather detailed discussion of the best means of securing and maintaining a stand of alfalfa. The special features under this head are the necessity for inoculation and liming, especially in the East, and the importance of midsummer or late summer seeding to avoid the weeds of summer on one hand and the danger of winter killing which attends fall-seeded plants on the other.

In discussing the utilization of alfalfa the relative value of the different forms in which it is used is given as well as the best methods of harvesting and preparing it in its different forms for use as feed. A brief account of alfalfa seed production and alfalfa varieties is given. The enemies of alfalfa are listed and the general methods used in combating them are briefly noted.

The wide distribution of alfalfa in this country necessitates different methods of procedure in securing a stand in the various sections. The country is divided into seven sections and specific instructions adapted to each are given separately for each section.

This bulletin is intended primarily for people who are about to undertake the production of alfalfa or who have already made unsuccessful attempts to establish it on their farms. The widespread interest at the present time in the extension of alfalfa makes this bulletin an especially timely one.

Wherever alfalfa can be successfully established it results almost immediately in doubling the value of the land. This indicates the importance of the extension of this forage crop. The production of alfalfa during the past decade has been greatly increased in many sections of the country where it had been thought impossible to produce it. It is found, however, where the necessary requirements are understood and provided for, that success, if possible, with this crop under a great diversity of conditions extended almost throughout the United States. Its production greatly facilitates the development of diversified farming so essential to the agricultural development of the country.

The bulletin is illustrated with a figure showing the common weed seeds found in alfalfa; also a figure showing the remarkable differences in the size of plants seeded at two-week intervals in the late summer and early fall, thus impressing on the farmer the advantage of seeding early for the best results. The method of baling as practiced in the alfalfa districts of the West is also illustrated.

FREE LUMBER.

Some interesting correspondence in regard to the international aspect of the question of repealing the duty on lumber and other forest products has been given out by the National Forest Conservation League, which is taking the position that the first step in forest conservation is to repeal the tariffs which prevent American consumers from freely drawing on the forest products of other countries. This correspondence is between Senator Wm. C. Edwards, a member of the Canadian parliament, of Rockland, Ontario, and a large manufacturer of lumber and pulp in Canada, and the secretary of the League. Senator Edwards was the official representative of the Dominion at the recent Conservation Commission Conference in Washington, D. C.

From this correspondence it appears that although most manufacturers of lumber in the United States object to the repeal of the tariff on lumber, alleging inability to compete with Canadian lumber, the Canadian market has this year been flooded with American lumber, there being no Canadian duty on rough lumber, to such an extent that the Canadian manufacturers have been undersold at home and have had their market ruined. In consequence the lumbermen of Canada made an effort to have a retailiatory tariff placed on American lumber, but this agitation failed, largely, it is said, on account of the remarkable telegram sent by Senator Edwards to Sir Wilfrid Laurier. It is stated that the Canadian importations of American lumber have been chiefly low grades, competition in which, the lumbermen appearing before the Ways and Means Committee said they most feared.

Under date of Dec. 17, Senator Edwards writes to the secretary of the League:

"Recalling the promise I made to you at Washington a few days ago, I herewith enclose copy of the telegram I sent Sir Wilfrid Laurier in June last after a large deputation of lumbermen had called upon him and our minister of finance, begging for the imposition of a duty on southern pine coming from the United States, which was then and for the most of the time since, deluging our Canadian markets, produced and sold so cheaply that it has been impossible for us to compete. Hard of course for the moment on lumber producers; but a great benefit to the buyers and users of lumber.

"The ground I take is that we will win in the end. If you Americans are foolish enough to exhaust your forests, not only to supply your own wants, but ours also, our timber will grow and become more valuable in the meantime, which will result in great ultimate profit to us."

THE FARMER.

Whatever may be the ultimate uses of the products of the farm, agriculture is primarily engaged with the economical nutrition of plants and animals. Agricultural science deals with the relations of physics, chemistry, and the biological sciences to every phase of every problem that the farmer may meet in his daily work. There is ample material in the results of the investigations that have been made in any one of the many branches of agricultural science to illustrate the value of scientific study to the farmer, and to plan a long series of experiments that can be successfully carried out on any well-regulated farm.

All food for men and animals is directly or indirectly the product of vegetable life. Therefore, before the nutrition of animals and men can be achieved to the best advantage, a thorough acquaintance with the laws governing the nutrition of plants is necessary. For the successful production of any plant an abundant supply of every kind of food necessary for its growth must be present in a readily available form in the soil or in the air. It is just as impossible to grow plants in a soil containing only available nitrogen and potash, or lime and phosphoric acid, or silica and iron, as it is for a carpenter to build a modern frame house with only window glass and nails, or with only boards and mortar. It is just as useless to expect a plant to thrive in a soil deficient in potash, even though abundantly manured with nitrogen and phosphoric acid, as it is to expect the carpenter to build the house with a million feet of lumber and no nails. It is quite as futile to attempt to feed a plant nitrogen in the form of coarse leather scrap as it would be to furnish the carpenter the iron he is to use for nails in the form of pig iron. In brief, every vegetable structure is made up of certain indispensable chemical elements, which must be accessible in available form throughout the period of its growth. It is one of the most important duties of the agricultural scientist to learn what these indispensable elements are and how most economically to supply them in highly available form to growing plants.

The preparation, or rendering available, of plant food for the growing crop is just as important as is the preparation of food for human beings. —Prof. Ervin E. Ewell in Yearbook of the Dept. of Agriculture.

RHODE ISLAND OYSTER FARMS.

Oyster cultivation in Rhode Island is a big industry prosecuted in a big way, and it is an industry that gives excellent promise of becoming more important to the state than any other, for in it hundreds of thousands of dollars have been invested; invested not from a speculative motive but from a wise appreciation of the tremendous advantages of Rhode Island as an oyster producing state.

To all intents and purposes Narragansett Bay is one huge oyster farm, over 15,000 acres of its waters being under cultivation. It seems impossible for the layman, traveling over the bay's expansive waters on summer excursion or business trip, to realize that from twenty to fifty feet under the surface of the waves which hurl themselves against the steamer's prow there are laid out in mechanical regularity farms as large or larger than any of those on shore.

A Rhode Island oyster farm ranges in size from the one of two or three acres to that of many hundreds.— December National Magazine.

GOOD SUGGESTIONS.

Fruit trees should be planted in the poultry runs. Fowls take naturally to the woods and brush, and find there much insect food that is good for them and injurious to the trees. Apple, mulberry, pear, plum and cherry trees, if soil and location are suitable, may be planted in the poultry yard, and the profit from the fruit should almost equal that from the hens, thus giving best results from the ground occupied.

Trinidad Lake Asphalt

Small Fruits and Vegetables

PLANTING AND CARE OF TOMATOES.

THE following interesting paper was read by H. E. Hart at La Habra Farmers' Institute:

I find that the growing of winter tomatoes requires much more care and study than I was led to believe before I began to grow them.

Seed.

The first thing is good seed. Stone's Improved Winter Tomato is what has given us the best satisfaction.

We plant the seed at two different times, first planting about the m. of April and later about the first of May, so that if we fail to get a good stand the first setting we will have plants to fill in later. We grow the plants as fast as possible with water and cultivation until about three weeks before we wish to set the plants out, and give them no water or care the last few weeks before we are ready to set. Our object is to harden the main stem of the plant so it will not lop over after we set it out. My experience is that if the plants wilt very much many of them get sunburned and die.

Setting.

We aim to set out our plants about the first of July. They should be from 8 to 10 inches high and about as large as a common lead pencil, the more stocky the plant the more sure you are to have them grow. I never set a small plant of any kind in this country if I can help it. Tomato plants do well with us even if they are in blossom when set.

Have had quite a little trouble with our seed bed, with what is called "damping off," that is, the plants seem to stop growing and die after they are an inch or two high. Have had the best results against this disease by covering my seed bed quite thickly with unbleached wood ashes before the plants were up. Have ruined my plants twice by putting the ashes on the plants after they were up; have never lost any when I sowed the ashes on the bed and let the plants come through them.

The plants do much better to have the land dry when you take them up and almost have to grub them out, than to have the land so wet you could pull them up. When the plants are taken out dry, the minute the moisture touches the roots they begin to freshen up, instead of wilting and lopping over. Have had the best success in getting a good stand by setting the plants in the furrow while the water is running. I think the rows should be 8 feet apart and the plants 4 feet in the row. I set the plants on the opposite side from the furrow turned, so that I can turn the furrow back onto the roots of the tomato plant and by so doing I can work the land and around the plant a day or two sooner than I could otherwise. I set the plants quite deep—nearly up to the first leaves—and never take the tops of the plants off.

Irrigating.

I think two irrigations, if you do a good job, is a plenty. I irrigated my tomatoes last year three times after setting, once after I began to pick them. Am sure they got too much water too late in the season.

I strive to have the vines as large as possible before the cold nights come along, and as much fruit as I can grow. The fruit will mature and ripen when it is pretty cold if the vines are large; it seems to protect itself, but a late small plant I never have been satisfied with in the winter.

Picking.

We will suppose the crop is nearly ready to begin picking; don't wait too long, go over them often if there is not too much of a picking, for pretty soon they will come with a rush and you do not want any over-ripe tomatoes on the vines. Just shippers you are after. Of course we grow our winter tomatoes for the eastern markets, but there will always be some that are not shippers. We have found the Los Angeles market pays us better than to send them to the cannery. Have never taken less than 15 cents per box, and that but once, which is about $10 per ton, as against $7 per ton at the cannery. Have received as high as $1.60 per box.

Our experience has been in shipping to Los Angeles it is best to put them up in as attractive shape as possible as to size and ripeness. Received quite a little more last year from the Los Angeles market than I did from the Vegetable Union.

Now as to the cultivation of my tomatoes, they have received two or three cultivations after each irrigation and been hoed twice.

PEANUT RAISING.

Many methods of planting are successful; perhaps the one most generally used is to plant in rows two and one half to three feet apart, with one seed every twelve inches in the row. Clean cultivation should be given as often as necessary to keep down the weeds and preserve a loose surface. Sometimes the rows are hilled up, forming ridges, but this plan does not usually result in greater yields than where level culture is given. If the crop is planted for hog pasture, the hogs may be permitted to do the work of harvesting after the pods are nearly mature. While hogs do not eat the vines readily, they are very fond of the nuts, and every hog grower should have a patch of peanuts to add to the variety of food for the hogs. If the crop is prepared for market the harvesting should be done before frost. For rapid work an implement with a cutter to run beneath the plants, cut off the tap roots and loosen the soil is necessary. The loosened vines with peanuts attached should be forked into windrows, and when partially dry placed in small bunches or stacks. If the crop is to remain long in the field, the stacks should be covered with straw or hay to keep out the rain. Where only a small acreage is grown, the peanuts may be picked by hand, but where grown on a commercial scale a peanut thresher is essential. The peanut straw, if in good condition, has considerable feeding value for cattle and is an important feature of the crop. While it is doubtful if many farmers would find peanut growing profitable on a large scale, it is certain that many could grow a small acreage to advantage.—Journal of Agriculture.

North Yakima, Washington, is planning to make an immense display of honey at the Alaska-Yukon Fair next summer.

Wood ashes applied to stiff clay soils have a fine effect upon orchard land.

The Ornamental Garden

PLANTING SPRING BULBS.

(Continued from Last Week.)

Shelter From Winds.

Bulbous plants are peculiarly susceptible to dwarfing by cold winds. A wind screen will double the height in many cases and in cut flowers length of stem is very essential. Always study this when planting them.

Soil.

My practice and observation coincide in making me think that they can be made to thrive in almost any medium soil. At the same time there is an element of experiment in planting them in untried soils and it is well to stay on the safe side. What we know here as a river loam is the best of all. That is a soil made up of about two-thirds sand to one-third clay silt. To this add about one-eighth of well-rotted cow manure and you have a soil pretty sure to give good results. At San Francisco the mixture of clay with the ocean sand and manure gives the same compound. The soil in Holland is as near as possible such a compound. There they fertilize heavily with well-rotted manure and then plant a crop of potatoes to take the strength away. Almost any California garden has old soil of almost this identical composition.

Drainage.

This must be perfect. If necessary put a layer of broken bricks or gravel under the beds. A soil that stays wet or soggy will never give good results in Tulips or Hyacinths although Narcissus will grow well in swampy soils.

Depth to Plant.—Barr, the celebrated Daffodil specialist, gives this rule: Plant one and a half times the height of the bulb. That is, put that much soil over it.

Protection From Gophers and Other Rodents.

Rodents will not touch Daffodils, but greatly like Tulips and Hyacinths. If they are troublesome about the place it will be safer to make a box of two-inch redwood planks to plant them in. This can be set into the ground so as to appear as an ordinary bed. It should be lined on the bottom with some porous material and have soil about ten inches deep. It is a very satisfactory arrangement.

Distance Apart.

This depends almost entirely upon the size. If the bulbs are lifted and reset each year, twice the diameter will do. If they are to remain longer, a space four times the diameter should intervene.

Digging Up and Keeping.

In case you have a bed which is well made and where it need not be watered during the midsummer, it need not be lifted for three years. By that time the formation of new bulbs and the exhaustion of the soil will make a move necessary. I would, however, advise that Tulips and Hyacinths be dug every year as soon as the leaves die down, that they be stored in a cool, dry place without any packing material and be replanted in August and September. By so doing much risk from rot, rodents and overwatering is avoided.

It is not so easy to give a rule for lifting Daffodils. In damp soils Daffodils hardly ever become quite dormant. Some varieties are injured by being taken up every year. The finest flowers will be had from masses of Poet's Narcissus which have been undisturbed two or three years. By the third year the offsets will begin to crowd and the bulbs are better lifted and reset.

Varieties.

This is too large a question for the space. In Narcissus the variety is wonderful. I would strongly recommend growers to try many of the less common sorts. By all means grow the Late and Darwin Tulips, and also Gesneriana. They are superb cut flowers. I prefer singles of all classes.

The very largest Hyacinth bulbs are apt to produce several not overly large trusses. A very compact, medium-sized bulb will give a single, fine stem and be more satisfactory. Buy named varieties. Neither the best varieties nor the best bulbs can be had in unnamed sorts. Fine Hyacinth bulbs are never cheap.—Carl Purdy.

LITTER ABOUT THE GROUNDS.

Then the general litter which clutters our grounds demands attention. There are the dead leaves and the broken weeds which have long been wafted about by the winds until at last they have secured temporary lodgment in some sheltered spot. There are the decayed limbs which have fallen from the trees or even the living ones which have been torn off by unfriendly gales. There are the shingles which have become loosened from the roof and scattered about. There are the ever present pieces of waste paper which are perpetually blown hither and thither. All these and many more conspire to destroy the beauty of our grounds. Each spring, in accordance with the usual custom, there is a general cleaning up when the grounds are gone over carefully with a rake and all the collected litter is consumed with fire. This is a most commendable practice, and its adoption should be urged upon all those who are not devotees of this spring out-of-door- cleaning. Then the grounds may stand in need of cleaning at other seasons. For a limb is liable to fall from a tree, waste paper is quite likely to be blown from the house or from other parts of the grounds, the dogs can be expected to bring in bones and pieces of wood in their frolics and the children may possibly clutter up the grounds in their play. So perpetual vigilance is required to keep our grounds free from litter, though no very great amount of labor is necessitated by this careful maintenance.

Sow pansy seeds and transplant those started last month into prepared beds. Have the cold frames ready for them.

IN THE YARD AND LAWN.

Lawns need watching this month, and attention should be paid to the old leaves and rubbish, which makes the yard look so untidy. Hedges should be trimmed. If you prune your shrubs and roses now, early flowers will result. It is the right time to set out rose plants. By sowing your lawn now with seed of Blue grass, a beautiful green growth will be kept up during the period when Bermuda is unsightly.

"I am the rain!
And I come as I will,
To vale and to hill,
Patter loudly or still—
Never in vain."

Six of the Most Valuable
New Fruits
Ever Introduced in California

"Improved French" Prune Originated by Luther Burbank

"Concord" Walnut French Variety
Grafted trees only. Better than Franquette or Mayette

"Paul" Cherry Finest Black Cherry

"Philippi" Grape Handsomer than Tokay; a month earlier. Disinfected cuttings only, to comply with quarantine laws.

All these, like Muir, Lovell, and Phillips Cling Peach, are of California origin.

"Comet" Red Currant Much larger, earlier and sweeter than any other.

"May Duke" Gooseberry
Earliest of all; large; smooth skin.

Irrigation and Forestry

THE EUCALYPTUS.

The following was written by H. A. Green of the Tin Can Club of Monterey for the New Era of that city and as he says may contain "useful hunches" to those who have little experience with this valuable tree.

Fuel Problem.

It seems evident that the eucalypts are to solve the fuel-wood problem of California, and could be made to do so for other localities possessing a mild climate.

The subject of growing eucalypts is receiving much attention at this time, and literature regarding it is sought for by many. The object of this article is to convey some useful "hunches" to persons contemplating growing this wonderful tree.

The planting of eucalyptus in this country commenced in California in the early seventies, and resulted in a number of fine eucalyptus groves, from which we have derived a knowledge of the tree, its habits, requirements, etc.

Notwithstanding the fact that the individual who causes trees to be planted is a public benefactor, his name is quickly lost sight of. It seems to me that persons, individually or collectively, causing trees to be planted in parks, highways, streets or private grounds should have their names suitably inscribed, so that future generations may know to whom they are indebted for the pleasures, comforts and benefits derived therefrom. Then raise your hat to the worthy citizens accountable for the eucalyptus plantations in California.

Of the 150 species of the genus eucalyptus identified by botanists, only a few of them are recommended for general planting; among them, giving their common names, are gray, blue, red, lemon, sugar and manna gums.

It Warps.

We hear a complaint made that the eucalyptus timber warps and checks too easily, yet it is no worse than maple or other hard woods seasoned by the million feet in the Eastern states. Eucalyptus sawlogs should be manufactured as soon as possible after cutting, and not be exposed to the wind or sun. If logs intended for lumber must be held, paint the ends and pile them in the shade without removing the bark.

Finest Hard Wood.

Unfortunately we have no hard wood timber growing on the Pacific coast in commerical quantities except eucalyptus, and some of them posess qualities similar to the eastern hickory and ash. At this time eucalyptus lumber is worth from $100 to $150 per thousand, a much lower figure than other hardwoods bring. A large tree which will produce from four to six cords of wood, will cut into from 1500 to 3000 feet, b. m., making such a tree worth from $12 to $25 to the grower as stumpage under present conditions. Blue gum pile timbers are now selling from $5 to $15 apiece on the stump.

Estimated Returns.

To give an idea as to returns which may be expected from an eucalyptus plantation venture, a few figures, taken from actual experience, may be interesting to the reader. Cost of preparing land and planting trees, about $20 per acre. Returns from fuel wood in 8 or 9 years, 50 to 60 cords (Californian.) or 96 cubic feet. When 25 years old the trees should produce about 28,000 feet of merchantable lumber per acre. After cutting for lumber the second growth should yield at least 100 cords (Cal.) per acre in five years.

Globulus Best.

It would seem that the blue gum is best for general planting. While the gray and red gums will stand more cold, it is not advisable to attempt to grow them where the temperature drops below 22 degrees F. The manna is a rapid grower, but its timber is neither strong nor durable. The red gum thrives in swampy places and makes durable lumber, although it is inclined to be brittle and crooked. The sugar gum is believed to produce the best poles and ties. When grown on arid land its timber is stronger than the others mentioned. The gray gum is a rapid grower and furnishes timber of average strength and durability. The lemon gum has a straight stem and is more particularly recommended as an ornamental tree.

Good for the Dog.

Having in mind the experiences of a neighbor who carefully planted the whole cones or strobiles of an eucalyptus tree without satisfactory results, and another who actually was in the habit of pulling up cuttings which she had planted, to administer punishment to an unruly dog, then returning the plant to the ground, expressed herself as being unlucky in trying to grow trees, I will presume that some of my readers may require some detail in instructions as to how to raise eucalyptus.

The seed can be obtained from almost any seed firm, but for persons in California, where mature trees are so common, I advise them to gather their own seed, unless they intend to plant on a large scale. The ripe cones containing seed will be found on the lower branches. Only take those without holes in the caps and which are a brown color. By subjecting the cones to the sun for a few days they will release their seeds, which are of irregular shape, black and imbedded in yellowish chaff. It is not necessary to separate this chaff from the seed in planting. Place about four inches of loose soil in a box and level it off evenly, then sprinkle the seed over the surface. Now press down firmly using a flat block.

Over the smooth surface sift about an eighth of an inch of coarse, clean sand. In order to better retain moisture and also to prevent "damping off," scatter a thin layer of sawdust or, better still, pulverized horse manure when dried. A good soaking with water is the next thing to be done. Use a small watering pot or can perforated with small holes, for the seed must not be disturbed. Put box in warm sheltered place and after a week watch for the baby trees to push through.

Transplant.

When your plants are about three inches high remove them in tin cans properly drained with large holes in their bottoms and filled with good earth that will not pack hard. Use a table knife to transfer the seedlings and do not expose their roots. Place your cans in some protected spot and partially shade the trees, for the h

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Budding Cloth.

In your issue of January 7 you gave a formula for making budding cloth. How is it used? Would the wax formula do for grafting? And is this cloth good for wrapping around the ends of limbs after grafting?—T. J. F., Fair Oaks.

This budding cloth is used for tying buds after the process of budding. It is used in strips about three-quarters of an inch wide and wrapped over the inserted bud immediately after it is cut and placed in position. The wax which is used in making this cloth is practically the same as that used for grafting. We have seen the cloth used to cover the end after grafting, but as a rule the application of the wax direct to the wood is preferred.

Concrete Tank.

I wish to build tank stand for water, say 15 feet high, on top of which I want to build a cement tank of 4000 gallons capacity. How thick should the walls of each be and what proportion should the concrete and cement be?—Inquirer, Riverside.

We do not fully understand what the inquirer wishes to know, but if we get the right idea he wishes to build a stand 15 feet high on top of which a 4000-gallon tank is to be constructed. Such a structure of reinforced concrete would be very expensive, vastly more so in fact than a tank made of redwood staves supported on timbers. Such a structure, especially when reinforcing is done, should be done under the supervision of one versed in handling reinforced structures. So far as the strength of cement is concerned the ordinary formula for a good strong cement is 1:3:6, though if used where an exceptionally strong mixture is desired, the 1:2:4 formula is safer. By 1:2:4 we mean one part good Portland cement, two parts coarse sand, and four parts of the stone or clean, coarse gravel. The principle on which reinforced concrete works is that the steel bars or wires which are used in the reinforcing are to take up the tension while the concrete if well made will stand any amount of compression. The discussion of its problems are not such as the Cultivator is fitted to handle even if it were profitable to subscribers. We believe a wrong impression has been given as to the cheapness of concrete construction by the widely published plan of Mr. Edison that patterns for concrete houses could be made so as to immensely cheapen construction of common houses for laborers who have little means. This may be brought about in the future, but at present concrete construction, especially if reinforced, is vastly more expensive than lumber.

Commercial Fertilizer.

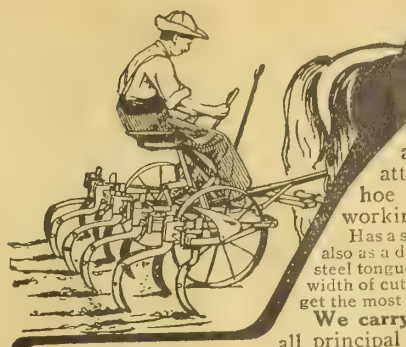
Please advise me what kind of commercial fertilizer is best on a market garden? Is nitrate of soda better than a complete high-grade fertilizer, and what is the after effect on the ground? Would the soil be less productive the next season if fertilizer is used? Where can I get nitrate of soda in Southern California? Will commercial fertilizer pay on dry land with 15 inches of rainfall?—H. F., Ontario.

Without knowledge of the present condition of your soil or the kind of crop you wish to grow, it is impossible to give definite information. This is especially true as to your question whether nitrate of soda is better than complete high-grade fertilizer. Ordinarily we would say decidedly no. That is, you must bear in mind that nitrate of soda contains only one of the elements needed by plants and of that only about 16 per cent. The balance is material which is of no value to you. It does at times, however, have a wonderfully stimulating effect on plants which are in need of immediate help and has been used with great profit. With the information which you have given us we should say decidedly to use the complete fertilizer. This will not contain the percentage of nitrogen which the nitrate of soda does, but will at the same time contain both phosphoric acid and potash in sufficient quantity to insure any ordinary crop. We would not care to risk any very heavy fertilization on soil which is not provided with irrigation. That is, fertilizing with commercial fertilizer is extremely expensive and without irrigation you are at the mercy of weather conditions. In case of failure to meet the conditions required for the crop your application for fertilizer would be largely lost. The application of fertilizer, however, could hardly make soil less productive the first season after its use. That is, excepting in this way: For instance you make a liberal application of gypsum to your soil, in itself containing no fertility whatever, but having a chemical action upon the soil which releases plant nutriment. The use of this substance would consequently reduce the actual plant nutriment in the soil. Nitrate of soda may be secured by addressing Holcombe Co., 24 California St., San Francisco, or of Balfour Guthrie Company, Los Angeles.

Rhubarb.

Is there good profit in growing rhubarb? Where is best all-season market for large or small quantities? What is best variety?—J. G., Fullerton.

There has been large profit made on many fields of rhubarb, also some have planted who have not secured satisfactory returns. The Crimson Winter, in a section which is not affected with too low a temperature, has produced a crop which has come in at a time of good demand. The ordinary rhubarb which comes in with its principal production in the springtime would not prove so profitable, we think, in your section. As to market, the present time is to a certain extent similar to the period which an Eastern farmer would say is "between hay and grass." That is, the production has not yet reached a stage of sufficient quantity to make a staple and regular supply for the Eastern trade and is at times rather heavy for local demands. There have, however, been single car-load shipments to Eastern markets which have proved exceedingly profitable. It has been claimed that this product could



Planet Jr.

Orchard Cultivator

A boon to every orchardist, grape-, and hop-grower! Particularly adapted to your work. Equipped with attachments which cultivate, furrow or hoe at any desired depth. Three sizes working up to 7 ft. 9 in. wide at one passage. Has a side-hitch and fruit-tree shield. Can be equipped also as a disc-cultivator. Low wheels enclosed by frame; steel tongue, strong construction, adjustable for depth and width of cut. Easily handled. You need the Planet Jr. to get the most profitable yield. Fully guaranteed.

We carry stock in San Francisco. Agencies in all principal Pacific Coast cities. Write for name of nearest agent. Write today for new illustrated 1909 catalogue of Planet Jr. Orchard Cultivators, Beet Cultivators, Horse Hoes, Seeders, Wheel Hoes, etc. Mailed free.

FARM LANDS FOR SALE.

U. S. GOVERNMENT LAND IN CENtral California if you can get $160 now and want 160 acres of rich productive soil, rolling, in four to ten miles of railroad and good town. About one-half can be plowed; all good pasture. Near producing oil wells. Extra good market and wages. No alkali or malaria. Any deeded land sells well. People suppose this land belongs to absent owners. I give the best of proof. it is ready for you to get now. I can give best of references that I am a man of my word and a reliable farmer. I have spent much time and money searching records and finding corners and found some good land for myself. I do not like this locating work and only do it because I am in debt and want to pay up, educate my family and get a home improved. When U. S. records your land and accepts your first payment, I charge you 50 cents an acre as part payment for my services, also $5.00 a day and all expenses, whether you take or not. Land can be homesteaded or any man or woman can take 160 to 320 acres under improvement plan of $1.00 an acre a year for three years. No residence required. If you mean business, come to Cottage Hotel, Armona. Inquire or write JOE CLARK RANCHER, Route 2, Hanford, Cal.

IMPERIAL VALLEY—DO YOU WANT to help us pioneer the **Weston Townsite** and get paid for it by getting in on the ground floor on the first 10 acre tracts, "without money and without price?"

We can offer a few 10 acre lots surrounding the Townsite at $1000.00 each, to be paid for in work on adjacent tracts or on a share basis of planting to oranges or grape fruit or to vines and deciduous trees. WESTON is situated in the centre of the famous No. 8 Water District and has more than 50,000 acres of the finest garden soil in the Valley tributary to it.

Remember the history of the townsites of Brawley, Imperial, El Centro, Holtville and Calexico and profit while you may.

If you are free to go there we can help you and you can help us. For particulars apply to IMPERIAL INVESTMENT CO., 315 H. W. Hellman Bldg., Los Angeles, Cal.

FOR SALE—160 ACRES OF RICH virgin sandy loam land, 9 miles S. W. of Mendota, Fresno Co. Cleared and leveled. Unlimited pumping water. Land $20; with water $30. Free from alkali, hardpan and washes. This is your chance to get land with water worth $150 for one-fifth that price. J. E. FARNHAM, owner, Hollywood, Cal.

I make a specialty of orange and alfalfa ranches, and exchanges. 826 MAIN St., ROOM 9, Riverside, Cal.. N. R. BELL.

FOR SALE—LAND WORTH $150 PER acre with water at $40 while it lasts. Rich virgin sandy loam soil free from alkali, hardpan and washes. Leveled and cleared for irrigation. 11 miles south of Mendota in Fresno Co. This is your chance; write J. E. FARNHAM, owner, Hollywood, Cal.

BERRY PLANTS.

CLEARING UP PRICES ON ALL kinds of berry plants, pear on quince root, and nursery stock. State your wants. Wanted, Burger and Val de Penas grape cuttings. TRIBBLE BROS., Elk Grove, Cal.

STRAWBERRY PLANTS FROM ONE year old plants that have not been allowed to bear fruit. Brandywine and Sharpless, $2.50 per 1,000, 35 cents per 100. H. P. NELSON, San Jacinto, Cal.

FOR SALE — BERRY PLANTS; LOGANS, Giant Himalaya, Mammoth and Lucretia dewberries. Would exchange for rooted Tokay. A. P. HENNING, box 225, Cottonwood, Shasta Co., Cal.

FOR SALE—LOGAN, MAMMOTH, PHENOMenal, Himalaya, Blackberry, Dewberry; strong plants, $10.00 per thousand. Strawberries, $3.00 per thousand. GRIDLEY COLONY NURSERY, Gridley, Cal.

FOR SALE—LOGAN, MAMMOTH AND Himalaya berry tips, ten dollars ($10) per thousand. F. O. B., Laton, Cal., ADELBERT COOLEY, Laton, Cal.

HOGS.

REGISTERED BERKSHIRE AND POland China hogs, both sexes. C. A. STOWE, Stockton, Cal.

SITUATIONS WANTED.

A GOOD FLORIST, ORCHARDIST and nursery man, has experience in budding and grafting, also in drying fruit and poultry business. 55 years of age, married, no children, German, wishes a position on a country residence orchard or nursery as superintendent or foreman. Has resided in California about 18 years. References, under letter, A. S., Bureau of the California Cultivator.

MACHINERY.

POTATO MACHINERY FOR SALE cheap. Latest Model Aspinwall outfit, used to put in one crop on 25 acres last season, consisting of Planter with Fertilizer attachment, used 4 days, Seed Cutter, used 1 day, 4 row force pump sprayer for one horse, extra saddle attachment, used 15 days. Would trade for good young team of horses or mules, hay wagon, rake, cutter or building material. WILLIAM A. MATERN, 9th floor Huntington Building, Los Angeles, Cal.

FOR SALE—CHEAP FOR CASH, small pumping plant complete in good running order. MACHINERY EXCHANGE, 943 N. Main St., Los Angeles, Cal.

FOR SALE—RENT OR EXCHANGE, boilers and engines, gas engines, pipe and oil well casing, pumps, all sizes and makes; get our prices before you buy. A. CANNADY & CO., 691 N. Main St., Los Angeles, Cal.

FOR SALE—A COUPLE OF CENTRIfugal pumps slightly used. Standard makes. Bargains. 117 Bruno St., Los Angeles, Cal.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD. Box 6, Compton, Cal.

FOR SALE—UNION GASOLINE ENgines new and slightly used, at bargain prices. See us before buying. BAILIE & BRANDT CO., Agents, 943 N. Main St., Los Angeles, Cal.

SEED.

FOR SALE—CALIFORNIA BLACK walnut seed in sack lots. Wanted: Mayette, Franquette and Parisienne Walnut scions, also Rupestris St. George, Rip. x Cord. x Rup. 106-8, Rip. x Rup. 3306 and 3309 cuttings, grafting size. Address FANCHER CREEK NURSERIES, Fresno, Cal.

FOR SALE—THREE POUNDS CHOICE pineapple cantaloupe seed at a bargain. WM. KELLOW, San Gabriel, Cal.

VINES WANTED.

WANTED—A FEW THOUSAND MUScat, Thompson Seedless, and Malaga well rooted vines. IMPERIAL VALLEY NURSERIES, El Centro, Cal.

be made to net $800 per acre. To secure any such returns of course right market conditions, with fertile land and good output are necessary. What the future will develop as to this crop no one can positively predict, although many growers are very enthusiastic and planting heavily because of their belief in the demand for all that California can possibly produce. We would not advise depending entirely on local market. There are times when its returns are exceedingly good. There are other times when it is just the reverse, and this uncertainty is not desirable where one plants a crop which is not an annual. It is possible you can get information as to whether contracts will be made, by writing the Phalanx Company of Los Angeles, which is organized for the purpose of marketing this crop.

POULTRY

FOR SALE—WHITE WYANDOTTES, Hayes "Bred to Lay" strain. Eggs for setting, $1.50 and $2 per 15, $6 to $8 per hundred. Hens, $1.50 to $3; cocks, $3 to $5; trios, $6 to $10. Discount of 25 per cent. on hens and pullets in lots of 50 or more. Write for particulars. F. E. JUDSON, Carson Heights Ranch, San Pasqual Valley, Escondido, Cal.

BUFF ORPINGTONS—BLOOD AND breeding tells. Five years careful selection for points and laying; results, first prize pullets last year and 50 per cent. egg yield during moulting season this year. Eggs, $1.00, $1.50 and $2.00. Special prices on incubator lots. E. G. WALL, 1920 Monticello Ave., Hollywood, Cal. Phone Hollywood 1943.

HOUDAN EGGS, FINEST WINTER laying strain. Setting of 15, $2.00; 30, $3.75. Square deal assured. Order now. MRS. R. HEGI, Box 272, Dixon, Cal.

SINGLE-COMB BROWN LEGHORNS—EGGS $1.50 and $2.50 per setting, $5 and $7 per 100; cockerels, $2 and up, from Bright hens. MRS. C. H. VARY, Pomona, Cal.

WHITE ROCKS—SNOW WHITE, prize winning, bred to lay. Eggs $1.50 and $2.00 per sitting. W. E. B. SMITH, 820 Elm Ave., So. Pasadena, Cal. Phone Sunset, Main 2866.

CHAS. E. SMITH—BREEDER OF BARRED Rocks exclusively. Winners of the blue wherever shown. Eggs $3.00 per 15, stock for sale. GARDENA, Cal.

LIGHT BRAHMA, FIRST PEN, FIRST Cockerel at 20th Annual L. A. County Poultry Assn. show. Cockerels from same mating $5.00 each. H. J. SHOW, R. 1, Santa Barbara, Cal.

BLACK BEAUTY POULTRY YARDS—SOME of the best S. C. Black Minorcas on the Coast. Chicks, $12 per 100; eggs from selected matings, $1.50 per 15, $6 per 100. MRS. A. F. FRESE, box 456, Dixon, Cal.

SILVER CAMPINES, GREAT LAYERS, non-sitters, beautiful fowls, splendid foragers. Recently imported from Belgium. Eggs for hatching $3.50 per doz. E. SMITH, 3610 East First St., Los Angeles, Cal.

FIFTY MAMMOTH BRONZE IMported gobblers for sale at $5.00 each. For particulars address J. R. SNEAD, Dixon, Cal.

BRONZE TURKEYS, COCKERELS from first cock and first hen at Petaluma. For prices write H. J. SHOW, R. 1, Santa Barbara, Cal.

PRIZE - WINNING WHITE MINORCAS. Eggs for setting, $2 for 15; $3 for 30; $6 per hundred, f.o.b. express. C. S. LANE, Santa Barbara, Cal.

FOR SALE—BABY CHICKS, ALL VArieties, 100 lots upwards. J. STANSFIELD, 3301 East 14th St., Fruitvale, Cal.

RHODE ISLAND RED EGGS FOR hatching. Fertility guaranteed. $1.50 per 13; $7.00 per hundred. SCOTT WILSON, Altadena, Cal.

Pruning Raspberries.

How shall I prune my raspberries? They were planted last winter and pruned about 2½ feet above the ground once during the summer. They are the Surprise. How and when shall I prune blackberries? What is the rent for berry ground with pumping plant furnished?—Subscriber.

Cut all the raspberrry canes back to 2½ feet and thin out the weakest ones—allowing four to six canes to the hill. Blackberries should be pruned now. Select five or six of the strongest stocks and cut out all others. Cut back the ones to be saved to about three feet and if they have laterals, cut them (the laterals) back to about one foot.

I know of no uniform rate of rental. The Japs in this neighborhood offer from 30 to 40 dollars per acre, annual rent and pay the usual rate for water besides. That price is entirely too high from the growers' standpoint, and only the Jap can afford to pay it, which he sometimes does by disappearing on the day of final settlement. I should consider $25 per acre, with pumping plant furnished and the tenant to pay cost of running the plant, about all the business would justify.—Q. A. L.

Deciduous Gum Disease.

The bark of the trunk and some of the heavy limbs of my peach trees seems to split partly open and sends out a dark brown or black gum, which gathers in lumps. The disease is in young trees and works most in rainy weather. It seems to start near buildings and fences and works into the orchard. I spray twice a year with Bordeaux mixture. What is the disease and what is to be done?—L. J., Selma.

To which Prof. Ralph E. Smith of the Southern California Pathological Laboratory gives the following answer:

"I can only say that this is some form of gum disease, but the latter expression is a very general one. Peaches and the other stone fruit trees develop this gumming condition from a great variety of causes. The gumming simply shows that there is something the matter with the tree but nothing as to the specific cause. The indications in this case are that there is something wrong under ground in the conditions affecting the root. There are sections in your correspondent's part of the State where the seepage water from irrigation ditches has filled up the ground to a very considerable extent and the water level in these soils rises and falls many feet during the season according to the amount of water in the irrigation ditches. This has caused much trouble with peach trees of a nature somewhat similar to that which he describes. It may be, however, that the disease in this case is caused by some other condition which we have no means of knowing.

"I would advise your reader to dig down and examine the roots of trees in various stages and see if they are not affected. Also to ascertain the water level at different seasons, if there is any possibility of trouble of this sort. It is not at all probable that spraying would have any effect on this particular disease. There is something wrong under ground."

Cover Crops.

I would like to get the opinion of Mr. Mills about the advisability of

putting in a cover crop about the 1st of March or later. What would be the best to sow then to be plowed under soon as it has made its largest growth, probably about June or July.

After this had time to decompose plant another cover crop probably about Sept. 1st. What would be best for fall crop.

I want to put in two cover crops in orange orchard in one year. I have plenty water to flood same as alfalfa and can use it as long and often as necessary. Soil sandy loam, with good drainage. Will lack of cultivation and plowing in middle of summer be injurious to orange trees or crop.—D. Gervais, Anaheim.

Plant Whippoorwill Cow peas about May first, plow under in September, or better still, disk so as to cut them up fine, irrigate and drill in winter vetch. This can be drilled in with a disk grain drill of the Thomas pattern. This will circumvent the possibility of damage from summer plowing in the orange grove.—J. W. M.

Plums on Apricots.

Would you kindly advise whether or not a young apricot tree of second season's growth, could be successfully top worked to a Japanese or Japanese Hybrid plum. Which in your judgment would be the best method of changing, whip-grafting or budding in the branches.—Subscriber, Napa.

Whip graft in the latter part of February. If a good stand is not secured, bud the sprouts in July and August. Japanese plums do well on apricot.

Beans.

Which are the best beans to plant in black soil, not very sandy, or is there any other crop that would do better with or without irrigation? How would berries do?—L. K., Foster.

With irrigation and good cultivation lima beans will probably do very well in soil such as you describe. The yield will depend upon the season's rainfall. Berries do best on a sandy loam and with irrigation have been made to yield heavy crops in California. Without irrigation do not attempt it at all. As to any suggestion regarding other crops, it is impossible not knowing how near you are to market or what your market demands. The first thing the farmer should consider before planting is not what his soil will produce so much as what the market will consume at a paying price. Then investigate as to possibilities of the soil. The best soil on earth is a failure unless the product grown is in demand and at a price which will pay for the labor involved in its culture. Lima beans are a staple article and always command some price, and probably, as well as we can judge at this distance, will be as profitable as any crop you can raise.

Seedling Eucalypts.

Regarding growing seedling eucalypts in flats, is it best to make holes at the bottom to allow for drainage? Does the dropping of the rain from the lath damage the seed-bed? What will prevent it?—T. K., League City, Texas.

The best way to provide for the drainage is not to lay the shake or whatever is used for the bottom of the flats too closely together. If they have been made so as to be perfectly tight and hold the water then there should be holes made to permit of proper drainage. If the flats are placed under the eaves or where a quantity of water would drip upon them it would surely wash out the seeds, but the occasional dripping from the lath of a lath house would do no material injury.

Irrigation from Flowing Well.

I have a well which flows about one miners' inch and wish to raise tomatoes, lettuce and onions near it on light soil. Will sub-irrigation be satisfactory, that is, in deep ditches to flow into each one night? How far apart should ditches be? Would this method be less harmful than by flooding? Have no reservoir nor can I at this time buy engine.—F. L., Artesia.

The subscriber is laboring under great difficulties in trying to irrigate on sandy soil with flow of only one inch. One miners' inch means nine gallons per minute, which on sandy soil will disappear before it proceeds very far. Sub-irrigation, if by it you mean placed by pipes underneath the ground, would not be feasible because of its expense. It is unfortunate you cannot get small cheap engine or windmill to help out and increase its flow. Other than that we see no better way than to make hose attachment to the well pipe if you can and place this hose which may be of the cheaper cotton variety so as to carry from section to section as needed, then let run in well cleaned out ditch as far as possible. Another suggestion might be the excavation and making of a cheap reservoir. This would presume the well is high enough so as to construct your reservoir so as to still have fall to that portion of the ground in need of irrigation. With water at the surface as this is, a very cheap engine with cheap pump would answer the purpose most admirably if it could be secured.

Walnuts for Napa Valley.

Is the Placentia walnut adapted to Napa Valley? Is it an early or late bloomer? Does it compare with the Franquette in quality, size of nut and time of blooming? What kind of orange would in your judgment do well here? Will lemon and pomelo do well? Will the fruit be of as good quality as fruit grown farther south? I mean for small orchard, not for commercial purposes.—Subscriber, Napa.

The Placentia Perfection would not be well adapted to the Napa valley. It is a later bloomer than the ordinary seedling nut but at the same time is not so late as the Franquette. In quality it is equal to the very finest of the Franquettes, but the earliness of the bloom and the danger from frost would bar it in your section. The navel would probably give you the best result for home use. It is possible also a tree or two of Valencias, which are late oranges, would be desirable. We have never seen oranges grown in that particular section but think possibly you might find the skin thicker and more "rag" to the fruit than is common in the more typical citrus sections. Notwithstanding that, we have seen some very good fruit grown in sections very similar to Napa. The lemon or pomelo will not do well as they are more susceptible to the cold than is the orange. The nurseries you mentioned are thoroughly reliable and will give you first-class treatment.

Scab on Potatoes.

Please give directions for preventing scab on potatoes.—E. T. J.

Scab is a fungous disease which appears on the tubers. For treatment, clean ground should be secured, that is, ground which has not heretofore grown scabby potatoes. The seed should be immersed a couple of hours in a solution of formalin of the strength of one pound to 30 gallons of water. This is perhaps the simplest and cheapest, although some prefer the bichloride of mercury treatment, one ounce to six gallons of water. Immerse the whole tubers in this solution for one and one-half hours.

Much winter irrigation was practiced by the Bixby Land Company at Alamitos prior to the recent storm.

The SUCCESS SPREADER

First choice of everybody who knows spreaders. In use at nearly all Agricultural Colleges, Government Stations and Experimental Farms. Used at all Iowa State Institution farms. The only roller-bearing spreader. Recognized as being a horse lighter draft than others. Working parts strong and simple. No cog wheel gears. Power applied direct by strong chain drive. It cuts in half the time and labor of spreading manure and doubles manure value. Makes it possible to keep up soil's fertility with home-produced manure alone, no need to buy commercial fertilizers. You need a success spreader. It will make money for you—is doing it for thousands of farmers. **Success Book Free.** Write for it to

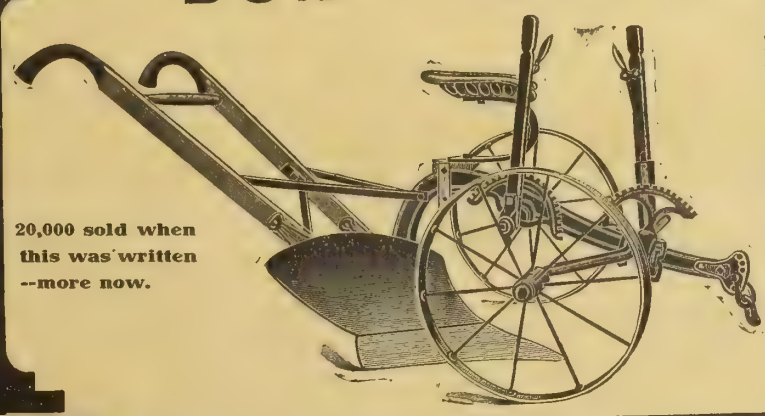
EVERYTHING FOR THE RANCHER.

DON'T WALK---RIDE!



20,000 sold when this was written --more now.

Both the man who looks for thorough efficiency and the man who makes price a deciding power, is pleased with the

Banner Riding Attachment

This all-service implement converts any kind of walking plow or harrow into a perfect riding implement. A wrench is the only tool needed.

Has a high lift and turns square corners, left or right.

It will plow any depth from 1 to 12 inches. Made entirely of malleable iron and steel—there is never a breakage.

It's a busy profit-bringer for right now.

TO PROVE IT:

We will ship the Banner Riding Attachment on 30 days' trial. If you don't find it all right, send it back. We'll pay the freight both ways.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

TWILIGHT ON THE DESERT.

'Tis twilight on the desert,
And o'er the changing sea
Of the Salton falls the shadows
On her depths of mystery.

And across her silvery surface,
The mountains, gaunt and grand,
Above the rose-tint cloudlets,
As on guard in silence stand.

The gentle breeezs from those peaks,
Across this sea sublime,
Softly whisper me their secrets
Of this warm and sunny clime.

And now above me in the skies,
The stars begin to gleam
And sparkle like diamonds
In a cool and silent stream.

But now, far off upon the night
Comes a dismal, sighing wail
Of a coyote, as he calls his mate
From out their hidden vale.

Then darkness comes and all is still,
And o'er this desert part
Of solitude and lonliness
There's naught to cheer your heart.

And as the night has quickly come,
From the glories of the day,
So does each person come on earth,
To live—then go his way.
—H. H. Ferris, in Yuma Examiner.

THE GUEST CHAMBER.

EVERY housekeeper takes pride in her guest chamber, and no matter how plainly it may be furnished it is always attractive if everything is clean and dainty-looking, and while this room should be as pretty as your means will allow, it should also be homelike and restful in every respect. When planning the room, comfort should be the first consideration, and if your means are limited, you can add many pretty homemade articles to the room that will not only please the eye but add to the comfort of your guest. Of course there should be a comfortable bed and then there should be a nice lounge or couch, and a pretty and serviceable one can be made ornamental cot, and this can be made ornamental as well as useful by covering with pretty denim or cretonne which should be put on to the top covering as a ruffle. Be sure to have a light blanket or comfort neatly folded and conveniently near ready for colder nights and mornings, and there is nothing nicer for this purpose than one of the pretty cotton blankets. There is nothing that adds so much to the appearance of the room as pretty bureau and table covers that are carefully laundered and these covers can be kept beautifully white with very little rubbing by putting them to soak for an hour before rubbing them out in a strong pearline suds and then rinsing carefully. But pieces that have colors in the embroidery should be washed and rinsed as quickly as possible. Have plenty of towels and good soap, but instead of furnishing handsome, long towels, which are really awkward to use, have a nice supply of small hand towels, as no towel should be used by anyone more than once, certainly never by two persons. On the toilet table have hair pins, pins of all sizes and a good lamp and plenty of matches, and on the small table, have pen, ink, paper, some of the late magazines and a Bible with good print. Have a brush and comb on the toilet table, as the daintest persons sometimes forget to bring their own, but be sure to clean these articles after they are used as the cleanliest head may have dandruff, which is easily carried to other heads in the same brush if used. —M. H.

WAYS OF COOKING THE APPLE.

Baked Apples, Creole Style.

Cook cored apples in a little water and lemon juice. Place in a dish and fill centers with jelly or marmalade. Add one-fourth of a cup of sugar to the liquid, boil and pour over the apples. On the top of each apple place a meringue, pressing it from a pastry bag through a star tube. Put the apples in a moderate oven for about eight or ten minutes. Serve cold.

Jellied Apples.

Peel, core and quarter two quarts of tart apples. Make a sirup of one and one-half pints of water and two cups of sugar, boil rapidly for 10 minutes. Cook the apples gently, a few at a time, until they are tender and clear. Remove them with a skimmer and spread on a platter. When the last of the fruit has been cooked add one-half package of gelatin which has been soaked in one-half cup of cold water for two hours, the juice of one lemon and stir until the gelatin is dissolved. Set the saucepan in cold water and stir until the mixture begins to thicken, drop the apples in and mix gently, turn into a mold and let harden. Serve with whipped cream.

Jellied Apples With Almonds.

Pare, core and quarter Golden Pippins, stew until soft and beat smooth. Make sirup by boiling a pound and a half of sugar and a pint of water for every two pounds of apples. Put the apple pulp and the juice of three lemons into the sirup and boil gently until stiff enough to drop heavily from the spoon. Pour into a wet mold and when cold turn onto a serving dish. Stick blanched almonds into the jelly and surround with whipped cream.

Apple and Brown Bread Pudding.

Mix two-thirds of a cup of chopped suet with two cups of Boston brown bread crumbs, add two cups of apple chopped fine, half a teaspoonful of salt a cup of raisins dredged with two tablespoons of flour and a half of a teaspoonful of ginger or mace. Beat one egg, add a cup of milk and stir into the dry ingredients. Steam in a buttered mold for two and one-half hours. Serve with creamy sauce.

Creamy Sauce.

Boil one cup of sugar and one-half cup of water to the soft ball stage; then pour the sirup in a fine stream over the well beaten white of one egg. Continue beating until cold; fold in one cup of double cream beaten dry; add one-half a teaspoon of vanilla.

Apple, Orange and Peach Salad.

Equal parts of apples, peaches and oranges are cut into cubes and mixed with cream dressing. Serve in apple shells or in the rind of the oranges.

Baked Apple Salad.

Bake Northern Spy apples until thoroughly done; remove the skin. Stuff the centers with nuts and serve with salad dressing and whipped cream.

Delmonico Apples.

Put a layer of apple sauce in a buttered pudding dish, sprinkle with crushed macaroons; add a little water and bake. Delicious when served with meat.

Apple Delight.

Put a layer of apple sauce in a buttered pudding dish, dot with butter, add a layer of chopped peaches and apricots, sprinkle with blanched almonds ground rather coarsely; repeat until the pan is full; pour the peach juice over the mixture and bake for one hour. Serve as a relish with meat course.

Fried Apples.

Quarter and core five apples without paring. Put into a frying pan one cup of sugar, one tablespoon butter and three tablespoons of water. Let this melt and lay in the apples with the skin up. Cover and fry slowly until brown.

ROAST CHICKEN.

And this is the accepted time to get rid of all the perplexities in the way of unsatisfactory breeders and hens that won't sit, or care for their families in a motherly way, and serve them up either in a fine roast or delicious chicken pie. If your own family cannot use them remember "there are others" to whom a fat chicken would be a rare treat, one which has never seen the inside of a cold storage plant, especially.

Sometimes a gift of a nice chicken like this would suit a friend far better than any dinky gift money would buy, and save hours of shopping as well.

To roast an old bird requires so much time, and the outcome is often so dry and tasteless after long hours in the oven, that a better plan is to parboil it gently until nearly done, then stuff and roast as usual, using the liquor in which it was parboiled for gravy.

To make a chicken pie, nothing is nicer than a fat old hen or two.

Cut up and cook until tender, either in a kettle or covered baking dish, then make your gravy and be sure there is plenty of it. Use a large dish, not a deep one, but wide enough across so that the crust may be all top crust and each person have enough. The under crust in a chicken pie is apt to absorb too much of the gravy to its own sogginess, and would better be omitted. A good rich biscuit dough is all right for the crust, mixed just as soft as possible to handle, indeed, I have had splendid success with crust made with a spoon, a little thicker than for dumplings, and it's quicker done.

Be sure and not kill the laying hens. If you have not the Hogan or Potter book to guide you in your selection, notice how wide she is when she walks, between her thighs, from behind. If she has the appearance of almost "straddling" she is either laying, or just going to, but if she is rather narrow between the shanks, you may be pretty sure she is not "full of eggs," worth three cents each.—Mrs. Frank Metcalf.

About the House

ARE you planning some pleasure for St. Valentine's day and Washington's birthday? Observe the day in some way—some little dainty for the table—a visit to a friend, a ride or drive, something out of the ordinary every day rut. In one house I know of, on St. Valentine's day you will always find a plate of heart-shaped cakes and candies on the table—and a little posie of some kind at every plate. And on Washington's birthday a tiny silk flag floats gaily in the centre of the dinner table, while two cherry pies guard the flag on either side.

For a valentine party a "heart hunt" will furnish amusement. Hide several hundred paper hearts about the house and at a given signal every one goes heart hunting. A few candy hearts may be hidden in various places—they will furnish refreshment during the hunt. If you want to hunt in couples, select partners by cards with the names of well known lovers of history or fiction written on them. The men who have cards with Hamlet, John Alden or Romeo written on them will look for Ophelia, Priscilla or Juliet.

When the hearts are all found the one or the couple having the largest number is given a prize—some flowers, a box of candy or a valentine.

The refreshments should carry out the "heart" idea. Heart shaped sandwiches, cakes and candies.

If you have a salad cut little hearts from pickled beets or cucumbers to use as a garnish, or have just a valentine cake and lemonade or chocolate. Bake any good cage in a shallow pan, ice all over with white icing and ornament with hearts and cupids and flowers—making it look just as much like a valentine as possible. Have a pretty table and serve the cake and lemonade or chocolate from that.

One of the jolliest valentine parties I ever attended was one where the guests were all staid married people who had long ago handed over most of their part of the frolics of St. Valentine's day to their boys and girls. So now they smiled over the dainty invitations to a "Proposal Party." and wondered just what a "Proposal Party" would prove to be.

Tied with rose colored ribbon, with tiny gold hearts—cut from gilt paper—encircling the date—February 14—the invitations were, as one silver-haired matron expressed it— "youthful and giddy enough for boys and girls of sixteen." But on the appointed evening there was a pleasant flutter of anticipation among the older people of the neighborhood and the pleasant rooms of the hostess were filled with a happy, jolly crowd.

After the greetings were over, the women were handed small cards, with the names of the men present written on them, and a blank opposite each name. And every man there made every woman just the prettiest "proposal" that he knew how to make, and after each proposal—if it pleased her, the woman placed a tiny rose colored heart after the man's name. If she did not think the proposal a good one a tiny rose colored mitten went on.

After the "proposing" was over and done with the hostess gathered up the cards, and then announced the name of the man who had won the most hearts and the one who had received the greatest number of mittens. Amid laughter, the prizes were given—tiny rose-colored pocket pincushions—a "heart" and a "mitten."

Sandwiches, rolled and tied with rose-colored ribbon—and sandwiches cut in heart shape—coffee and heart shaped cakes were served and then music. All the old songs that had not been thought of for years—and it was way in the morning hours before any one thought of going home.—Elbepe.

Mayer Leading Lady

THE CORRECT SHOE FOR STYLE, EASE AND GOOD WEAR

You could never hope to buy a more stylish or serviceable shoe than the "Leading Lady." It is right up-to-date in appearance and fits the foot perfectly from the very first. Besides being stylish and comfortable, the

Leading Lady

wears much longer than most shoes. It is so well made that it lasts twice as long as the average shoe, and will retain its shape to the end.

Why buy inferior shoes when, with the same money, you can get the "Leading Lady?" Your dealer will supply you; if not, write to us.

Look for the Mayer Trade Mark on the sole.

FREE—If you will send us the name of a dealer who *does not* handle Leading Lady Shoes, we will send you free, postpaid, a beautiful picture of Martha Washington, size 15x20.

We also make Honorbilt Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Special Merit School Shoes.

AMYGDALINA REGNANS.

(Continued from Page 115.)

"The tree endures low temperatures, but is injured by dry heat. It does best near the coast and at moderate elevations in well-watered mountain regions. In no part of the Southwest do the requirements seem fully met.

"The timber is not so valuable as that of many other Eucalypts, but is said to be useful for shingles, rails, and for planking in ships. It is comparatively light, floating on water. It does not usually last well underground, nor does it furnish fuel of good quality. The leaves are a source of Eucalyptus oil. Baron von Mueller states that the fallen leaves of this and some other species deodorize the soil. He recommends the planting of it in swampy fever regions, where climatic conditions are suitable."

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

San Francisco Markets

SAN FRANCISCO, Feb. 2, 1909.

Hay.

Country business which was very heavy up to the time of the recent storms has slacked off very materially, due only to the fact that it is difficult for consignees to receive and handle hay both on account of the possibility of it being damaged and the difficulty in hauling it over the roads which are in very bad condition. We anticipate that as soon as the weather clears and the roads become better that this country demand will be revived again, for none of the country districts have laid in sufficient feed for their season's supply.

Alfalfa has been arriving very sparingly and all receipts have been steadily absorbed here at top prices.

Citrus Market

LOS ANGELES, Feb. 3, 1909.

Oranges have gone forward heavily since the big storm and as a rule have found good market conditions. A slightly easier tone prevails, however, and returns are not quite equal to those of a week or more ago.

Lemons are rather weak and the importations are very large which affects the market unfavorably. There are at this time only few shipments from California.

Shipments:

Shipments to date this season aggregate, oranges 4180, lemons 1078 cars.

NEW YORK, Feb. 2.—Eighteen cars navels sold. Firm on good stock. Weak on frozen light weight fruit. Clear and cold.

EUCALPTS.

(Continued from Page 136.)

sun will soon injure them. Too much or too little watering injures equally It is preferable to water in the forenoon.

By following these simple directions you will have hardy trees and get a surprise at their rapid growth. By having your trees in cans they may be safely moved at any time.

Gullying is a method of land-washing that ruins land quicker than any other form. Owners of hilly or very rolling land must be continually on the lookout for little gullies and take means to prevent their enlargement. In dealing with this subject the Illinois station says the common practice is to scatter straw in the draws or build dams across them at frequent intervals. A coarser material used with the straw gives better results. A better plan is to keep the draws in sod even when the rest of the fields are cultivated. Almost any grass that forms a tough sod will answer the purpose, timothy and red-top being quite satisfactory.

FEEDING STOCK.

Concentrated foods should be fed in proportion to their percentage of protein, guided, of course, by prevailing market values. The prosperous feeder is the one who mixes his rations so that with the least cost the animal receives the greatest nutriment.

It is not the cheapest food per ton that can be purchased that is the most economical, but rather the food that is richest in digestible protein.

Feed Liberally.

If sufficient protein, fat and carbohydrates are not contained in the food, the cow supplies this deficiency for a time by drawing from her own body, and the quality and quantity of the milk will gradually begin to shrink. The stingy feeder cheats himself as well as the cow. Unusual excitement of any kind reduces the quantity and quality of the milk. Sudden changes of feed also affect the richness of the milk, but only temporarily. Regularity of milking is also of utmost importance.

Get the Most for Your Money.

By carefully comparing the composition of the many foods upon the market with the cost of the same it will be seen that there is often a wide disparity between the real value and market value of the different foodstuffs.

Balanced Rations.

By a balanced ration is meant a combination of foodstuffs that with the least waste will fulfill the animal's needs for 24 hours. This ratio of nutriments is often expressed as nutritive ratio, being the ratio which exists between the amount of digestible protein and carbohydrates and fat. To obtain this ratio multiply the amount of fat by 2.25 (fat having this heat value as compared with carbohydrates), plus carbohydrates divided by protein. For ordinary feeding a ratio of from 1.5 to 1.6 is considered economical.

A cow in full flow of milk, weighing 1000 pounds, should consume 24 pounds of organic substance daily containing approximately 2.5 pounds of digestible protein.

Cocoa Cake and Meal.

We particularly wish to call attention to cocoa cake and meal. This food contains 16.4 per cent digestible protein—is easily digested and possesses an agreeable flavor that is greatly relished by stock. It is especially recommended for swine and chickens. As cccoa meal is a highly concentrated food, possessing strong affinity for water, it should be stored in as dry a place as possible. If kept in a dry place cocoa meal can be kept indefinitely.

For chickens we suggest the following ration:

Food	Lbs.	Dry Matter	Protein	Carbohydrates	Fat
Wheat	5	4.58	.66	2.87	.09
Barley	4	3.60	.37	2.38	.09
Middlings ...	2	1.76	.24	1.07	.08
Bran	2	1.76	.22	.84	.05
Corn Meal ...	2	1.76	.13	1.32	.07
Cocoa Meal ..	4	3.44	.66	1.70	.40
Linseed Meal.	1	.90	.24	.24	.17
	20	17.80	2.52	10.42	.95

Nutritive Ratio—1:5 .

If the fowls are confined it is well to add a small quantity of meat meal to take the place of worms, etc. As few rations contain enough mineral matter, it is advisable to supply lime separately.

Farmers at Cucamonga are in trouble over the construction of the dam across the stretch of land which was built to prevent the flooding of the orchards below it, but it in turn deflected the waters of the recent rain so that other orchards were seriously damaged.

THE GREATEST CREAM SEPARATOR Money Can Buy

Sharples Dairy Tubulars have the finest known method of oiling. The driving gears, and the ball bearing which supports the bowl, are enclosed in the head of the machine. A spoonful of oil is simply poured into the gear case once or twice a week. The lower gear wheel dips into this oil and throws it in a spray over all the gears and the ball bearing. The oiling is perfect, is never forgotten, causes no trouble. All running parts are easily reached simply by lifting the gear case lid.

Sharples 1909 Tubular "A" Cream Separators are positively unequaled. Money can not buy, nor experience recommend, any other as good.

We have manufactured cream separators for 29 years. After making common "bucket bowl" separators for 20 years—the kind **all other** separator manufacturers **still** make—**we discovered that no "bucket bowl" separator can ever prove entirely satisfactory.** The bowls in all common "bucket bowl" separators are built and run up-side-down, exactly contrary to the law of gravity and every law of mechanics.

To overcome this fault; **still found in all other separators,** we invented, patented and manufactured the

Suspended Bowl Sharples Tubular

The Tubular has been on the market about ten years, is built in the biggest, finest separator factory in existence and is sold in great numbers all over the world. We also have Tubular factories in Canada and Germany.

Sharples 1909 Dairy Tubular "A" Separator has handsome, one piece frame equipped with plumb bob for quickly leveling the separator and keeping it level. It has waist low supply can; enclosed, dust proof, self-oiling gears; light, bottom fed bowl, hung below a single ball bearing. The bowl has no complicated inside parts. The Tubular is extremely simple and practical, is washed in 5 minutes, is approved by all women as easiest cleaned, turns easiest, skims fastest and best, wears longest. Look at the pictures, then write for Catalog No. 260.

The unequalled simplicity and perfect construction of Sharples Dairy Tubulars make them wonderfully light running, surprisingly convenient, remarkably durable, surpassingly efficient. Every Tubular is guaranteed forever against all defects in material or workmanship. Medium size Tubulars can be turned by one who is seated.

Cantaloupes Under Arid Conditions

An Instructive Article by Prof. R. A. Forbes of the Arizona Experiment Station

CANTALOUPE growing, as developed since its origin near Rockyford, in 1885, requires unusual judgment and cultural skill on the part of the farmer. Cooperative organization and good business management are also essential, for only by these means can the crop be properly timed and prepared for shipment, and necessary arrangements made with transportation and selling agencies.

In Arizona the first noteworthy acreage of cantaloupes was grown in Salt River Valley in 1899. Since that time the industry has steadily expanded until, in 1908, 368 cars of melons from about 1250 acres were shipped through five growers' associations, principally to markets east of the Mississippi.

Climate for Cantaloupes.

The most important prerequisite to successful cantaloupe culture seems to be an arid or semi-arid climate. In such a climate, in Colorado, under irrigation, melons from Eastern seed developed the superiority which gave rise to a new industry. An early growing season is an added advantage in that it gives the producer a wider range, in point of time, of markets for which to calculate his plantings. Dry, sunny climate, early seasons, fertile irrigated soils, and necessary commercial facilities are all to be found combined to excellent advantage in the irrigated valleys of the arid Southwest.

Soil.

Cantaloupes are grown to excellent advantage on light warm loams properly fertilized by the addition of the organic matter and nitrogen in which our desert soils are usually deficient. Heavy soils may also be used for cantaloupe culture, but are less easily prepared and tilled during the progress of the crop. Old alfalfa ground is most excellent for canteloupe culture; and well rotted barnyard manure is effective. Bermuda sod plowed up and exposed to the sun without irrigation the preceding summer makes excellent cantaloupe ground, the intensive cultivation necessary serving both to benefit the crop and to restrain this formidable weed.

Alkaline lands should be avoided, since soluble salts in excess, even though insufficient to kill the plants, are commonly believed to be detrimental to the quality of the melons.

Layout of the Ground.

The soil should be so arranged that the rows may be irrigated without submerging the vines and the fruit. One good way to accomplish this, and also to fertilize the soil, is as follows: The field is first irrigated, plowed, and harrowed to a condition of fine tilth. With a twelve-inch plow, at intervals of six feet, double furrows are then broken out, going and returning along the same lines. In the deep, wide furrows thus formed well rotted barnyard manure is distributed to a depth of three or four inches, then plowed in and the field again harrowed level. By this plowing towards the middles of the spaces between the fertilized furrows the soil is finally left in oval ridges separated by back furrows for irrigation. The rough furrows and ridges are then finished with a harrow and the newly prepared ground irrigated to establish the water line for guidance in planting.

Seed.

Seed should be most carefully selected with reference to flavor and appearance of the fruit; to good shipping characters, including small cavities and heavy netting; and to a tendency to produce melons of standard size. Early strains are desired for some situations; but in Arizona rust resistance is not a necessary character as this class of diseases is little to be feared under our arid conditions.

Seed should be purchased only from most reliable sources. Rockyford growers are at present the principal means of supply. Some associations go so far as to send a representative to Colorado to select in person the seed melons from which to supply their members. Home-grown seed in Arizona is sometimes sprouted and inferior, due to the heat to which the mature melons are oftentimes subjected in the field.

About one pound of seed is required for an acre. Cantaloupe seed improves to some extent with time, and is stated by experienced growers to give more satisfactory results at two years of age than at one.

Planting.

With irrigating furrows six feet apart, rows may be planted one on each side of each furrow. The hills should be ten feet apart in the rows, "breaking spaces" between rows. On this plan the ground will be quite uniformly occupied, with a distance of about six feet between adjacent hills.

With a hoe each hill is planted by making a small furrow a foot long just above the water line. About ten seeds are dropped in this furrow, covered an inch deep, and the soil pressed down lightly with the blade of the hoe. After early plantings, when frosts are feared, a second set of hills may be planted alongside the first, ten days or two weeks later. When danger from frost is past, while the plants are still small they are thinned to one or two of the strongest to each hill. Care must be taken not to overcrowd the ground with vines, as a high percentage of pony melons will follow. Under Arizona conditions the six foot spacing of hills recommended above, with not more than two plants in the hill, gives best results.

Irrigation and Cultivation.

A dependable supply of irrigating water is essential to successful cantaloupe culture. Early in the season when the plants are small and the irrigating supply is cold, water should be applied sparingly. But between the setting of the crop and the ripening of the first fruits, when both vines and melons are developing rapidly and when the weather is usually hot and dry, frequent and copious irrigation is necessary, for if water is stinted at this time a large percentage of small or pony melons is likely to follow. During the picking season water should again be sparingly applied—just enough to prevent the vines from wilting. This procedure gives quality and solidity to the melons, and incidentally maintains the field in convenient condition for picking.

As long as the vines will permit, the middles should be kept free of weeds by means of a one-horse cultivator, and the furrows run through with a small plow after each irrigation. The young plants should also be hoed by hand two or three times. When the ground is once well covered with vines weeds will make but little headway, even Bermuda grass being effectually checked by the dense cover.

Marketing the Crop.

The first shipment of melons from Arizona in 1908 was made at Yuma, June 13, about 130 days after planting. The season closed August 17 in Salt River Valley.

The critical operations of picking, packing, and shipping are usually under the supervision of the receiving company's agent. Riper grades are sent to local and coast markets; but for more distant Eastern markets the melons must be picked considerably before full maturity, when they part easily from the stem. In favorable weather the melons ripen so rapidly as to require picking two or three times daily. At the packing shed, which must be provided with padded benches to prevent bruising, the cantaloupes are sorted into three sizes—Ponies, Standards, and Jumbos, which are packed each in its own sized crate. The wrapped and crated melons are then hauled in spring wagons to the Association shed, where they are inspected and received usually by a representative of the commission firm handling the crop. The accepted melons are shipped in refrigerator cars, for the most part to Eastern markets.

Enemies.

The two principal enemies to cantaloupes thus far known in Arizona are the melon aphis and nematode worms. The aphis is especially favored by the mild climatic conditions of the Southwest, and is always to be expected even in new districts. It is much affected by extremes of temperature, being repressed by cold or wet weather and also by extreme heat. In southern Arizona the aphis is usually in evidence early in June, increasing rapidly until the crop is harvested and the vines destroyed. Kerosene emulsion checks but does not usually exterminate the aphis, which is difficult to reach with spraying apparatus on the under sides of the leaves where it is chiefly to be found. Preventive measures are more satisfactory than curative ones in the case of the aphis, which is first established at comparatively few points in a field by means of old females which have wintered over in protected situations. These pioneers colonize on the young vines early in the season, at which time, when the plants are small and easily treated, the grower would do well to assume the presence of aphids and spray the whole of his planting thoroughly with kerosene emulsion, diluted thirty times. Professor C. P. Gillette, of the Colorado Experiment Station, recommends fumigation with hydrocyanic acid gas, which he accomplishes by means of washtubs and potassium cyanide at the rate, to each three cubic feet of space, of one gram of cyanide dissolved in sulphuric acid and in the usual manner. The fumigations are continued five to eight minutes and, by means of several tubs used in rotation, may be rapidly operated. It is common practice, also, among growers to burn or bury infested plants early in the season. These are discovered by the wet or greasy appearance of the infested leaves due to the excretion of honey dew by the aphids or by the presence of a species of ladybird which preys upon them. It is important at the end of the season to burn all the old vines, thus lessening the number of possible hold-overs for the following year.

Nematode worms occasionally damage or destroy the roots of cantaloupe vines, especially when grown after crops favoring the development of these organisms, such as tomatoes, chili, egg plant, peas, and preceding crops of melons. Affected roots maye be recognized by their characteristic swollen, knotty appearance.

No satisfactory method is known for the eradication of nematodes, but infested ground may be sown to unaffected crops, such as alfalfa, and new ground employed for cantaloupes.—R. A Forbes, University of Arizona.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

THE O. & W. THUM COMPANY

Manufacturers of Tanglefoot Fly Paper Grand Rapids, Michigan

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

With the Citrus Growers

METHODS OF CONTROL OF GUMMOSIS.

FROM Bulletin 200 of the California Experiment Station we quote as follows from Prof. R. E. Smith's observation on control of Gummosis:

Avoid Unfavorable Conditions.

The most important consideration in regard to the control of gummosis is the fact that since the disease is brought about solely by unfavorable conditions it can be more easily prevented by avoiding those conditions than it can be cured after once started. By the same reasoning, the cure of the disease lies chiefly along the line of improvement of the conditions which have produced it rather than any treatment of the tree itself. The avoidance of gum disease should be one of the chief considerations of the grower starting a citrus grove, particularly with lemons.

In the choice of location heavy, wet ground should be avoided, unless it can be drained or improved in some manner.

Sour Orange Root.

On land which is otherwise desirable for planting, but has some qualities which would make it liable to gum disease, considerable immunity can be obtained by planting trees budded upon the Florida sour-stock root. We have made careful inquiry as to the success of trees upon this root in California, and find that there is ample experience to justify its use in heavy soils. The root has no advantage over the ordinary sweet seedling, except for the much greater freedom from gum disease which it imparts. Trees grown on the sour-stock are rather slow of development during the first few years, but bear abundant crops of fruit, and as time goes on they overtake those of the same age on sweet-stock, so that in mature trees there is practically no difference on the two roots. We strongly recommend the use of the sour-stock root for all citrus trees to be planted on heavy soil which is liable to gum disease.

High Budding.

Another important consideration for avoiding gum disease is high budding of the nursery stock. As we have previously shown, trees which are affected in the orchard usually have the point of budding deeply buried in the soil, and this condition contributes greatly to the disease. This may be easily avoided by budding the trees a foot from the ground, a practice which has no disadvantage except the somewhat longer time required to produce such a tree. Possibly an extra season may be necessary to get the young seedlings up to sufficient size to bud them at the desired height. The advantage gained, however, is much greater than this slight objection. Whether the trees are high-budded or not care should be taken not to plant them too deeply in the ground. Gum disease is induced in a great many young trees the first year in the orchard by planting them with the bud union below the surface, where they become covered with soil. This is extremely undesirable.

Cultural Prevention.

The prevention of gummosis in the orchard is entirely a matter of the avoidance of the conditions which have been shown to be the cause of the disease. The accumulation of soil or water about the trunks, allowing the same soil to become hardened, lack of drainage or cultivation, or the accumulation of surface water, either from irrigation or rain, must be carefully avoided. All these precautions are particularly necessary in places where the soil conditions are such as to favor the disease. In such places special care must be taken to keep the ground thoroughly stirred close up about the trunk of the trees and prevent either soil or water from accumulating about them. If this is accomplished one need have little fear of gummosis.

Improvement of Soil Conditions.

The treatment of affected trees must consist first of all in an improvement of soil conditions. It is idle to work upon the trees themselves or to look for any remedy for application to the affected parts until the original conditions which produce the trouble have been corrected. If this is not done, the work done upon the trees will be thrown away, since gummosis will begin again at the first favorable time. In treatment of affected trees, one should therefore begin with a thorough stirring of the soil about the trees clear up to the trunks. It will, no doubt, be necessary to do much of this by hand with a mattock, but there is no other method of accomplishing the desired result. After thoroughly loosening up the soil a space of at least two feet in diameter must be cleared about the trunk, removing the accumulated soil down to the roots, exposing the bud union. In many cases a foot or more of washed-in soil will be found at this point.

Cutting the Bark.

After this has been done, work may commence upon the tree itself to improve its condition. The bark of the tree where gumming has occurred may be cut out to some extent to relieve the pressure and permit the escape of the accumulated gum. In some cases the whole bark has been stripped off over all the affected portion, while in others only narrow strips of bark have been taken out, running from the crown up to the main fork on several sides of the tree. The latter process, on the whole, is thought to be the better method.

Stripping.

If the bark is stripped off entirely a large area is exposed on badly affected trees, and in some cases it is necessary to entirely girdle the tree. Under improved soil conditions much of this bark would be likely to recover and remain alive, or if it dies it serves to protect the trees and cover the new growth of bark, which often comes beneath it. Many cases, however, have been successfully treated by stripping off all the bark which showed discoloration beneath it, cutting out cleanly about the edges and painting over the exposed surface with some protective covering. In such treatment the bark should be peeled off without scraping the surface of the wood, as often much of the cambium layer is still alive and will form a new layer of bark.

Treatment of Wounds.

For covering the exposed surface, a form of grafting wax has been found most satisfactory. This is prepared

by melting together 4 pounds of resin, 1 pound of beeswax, and 1 pound of raw linseed oil. After thoroughly mixing, the wax is painted on with a brush while still warm and liquid. In many cases a considerable amount of new bark can be seen forming under this transparent wax, and the tree makes a decided recovery. A great variety of other materials have been used for covering the wound, but none of them appear to be as satisfactory as the wax.

Slitting.

The method of slitting the bark, taking out one-eighth inch strips on four or five sides of the tree, through both the affected and the healthy parts, is usually most advisable. A special knife can be made for this work with which the slitting can be done quite rapidly.

Surface Applications.

After cutting the bark in this manner some application may be made to the surface, and for this purpose many different substances have been tried. The application of neat's-foot oil, recently recommended by Judge A. F. Call, of Corona, appears quite effective, the oil tending to soften the bark and gum and keeping the latter from collecting in hard masses on the bark. A one-tenth solution of caustic potash in water has also been used with good results. Others have used crude carbolic acid, sheep dip, and a great variety of other materials. The liquid substance recommended should be painted over the whole trunk of the tree, making a thorough application.

Soil Improvement Most Important.

The whole matter of the treatment of the tree itself is entirely of secondary importance. If proper soil-conditions can be obtained and maintained, the tree will heal itself, if not too far gone. The only benefit to be derived from any method of bark cutting and surface application is to promote the healing of the wounds caused by the disease.

Pruning.

After treating the trunk of the tree it is well to cut back the top to some extent, reducing the amount of branches in proportion to the amount of bark lost from the trunk.

After the treatment of the soil and trees has been accomplished, measures must be taken to prevent as far as possible the recurrence of the conditions which brought about the trouble. When possible to do so, the general level of the soil about the tree should be cut down so that the point of bud union will be well above ground.

Use of Sand About Trunk.

If it is possible to do this, the hole which was dug out about the trunk must be kept open so that the soil will not accumulate again at that point, and at the same time this hole must not be allowed to become a receptacle for irrigation and rain water, thus making the conditions worse than ever. In such cases the practice of filling the space with coarse sand has been resorted to quite successfully, thus preventing the accumulation of water to quite an extent, and at the same time not producing a layer of hard soil about the trunk.

WATER IN THE MOHAVE DESERT.

The southern part of the Mohave Desert, the last strictly arid region crossed by tourists who enter Southern California by the Santa Fe or the Salt Lake route, contains small areas in which underground waters have been more or less developed. In a few of these areas the waters are sufficient in volume to serve as important sources of supply for irrigation. Although the climate of this desert, which lies about 3000 feet above sea level, is more severe than that of the valley of Southern California just to the south, it is nevertheless so mild that splendid crops of fruits, alfalfa, and grain can be raised wherever sufficient water for irrigation can be procured. The extensive mining and railroad development that has taken place in this part of the desert within the last few years has resulted in a local demand for all the agricultural products that can be raised, and even more. Hence the United States Geological Survey is constantly receiving inquiries for definite information not only as to meager supply of surface waters that flow from the San Gabriel and San Bernardino mountains to this desert, but also as to the quantity and availability of the ground waters that may exist beneath its surface. The desirability of preparing a report which would serve as a response to these inquiries has long been recognized by the Survey, but demands for work in other more important fields have been so urgent that an investigation of the Mohave Desert has not been possible until the present year.

This work has now been assigned to H. R. Johnson, a Stanford graduate and a geologist who has had varied experience in California problems. Mr. Johnson expects to spend two or three months collecting data in the field and will then return to the Washington office, where the information obtained will be compiled and published in a report that will be useful to all who are interested in the development of this region.

DEAD
CITRUS
WOOD

Is more or less prevalent in every orange and lemon grove, i. e., trees that are unprofitable. How many such have you in your orchard? Would it not pay you to put paying trees in their stead?

Your Home Grounds

Should contain at least a few trees of the better varieties of oranges and lemons. For this purpose we have some exceptionally fine trees to offer, being grown as specimens. Possibly you would like to plant a few citrus trees about your home this season. If so, will you do us the favor to correspond with us about it?

Citrus Fruits

Historically, Horticulturally, Commercially.

Our new booklet gives more valuable information about varieties, methods of planting, cultivating, pruning, picking, packing and shipping than anything of its kind ever issued. Sent anywhere for the small sum of 25 cents. Correspondence a pleasure.

IRRIGATE FROM YOUR OWN RESERVOIR

A reservoir on your own land makes you independent on the water question.

You will have no trouble in filling the reservoir during the spring rains, when all the streams, little and big are flooded.

Then you will not be at the mercy of ditch owners and other water users when the dry season comes.

The few acres you will require for the reservoir will not be wasted. They will serve to make all your other lands vastly more valuable.

Raise the Water With An I. H. C. Gasoline Engine

Of course you cannot have your reservoir on your high ground. Locate it on the bottom land where it is easiest made and certain to be filled with drainage waters.

Then pump the water wherever you need it with an I. H. C. gasoline engine.

These engines, always powerful and reliable, have been found to be excellently adapted to irrigation pumping.

They are operated with little expense. They require but little attention.

They enable you to utilize the waste waters such as deep streams, sloughs and ponds upon your own land.

The farmer who has a water supply of his own, so that he may irrigate a few hours now and again, without regard to whether the water is flowing in the company ditch, is the independent farmer.

A reservoir on your own land and an I. H. C. gasoline engine to give you the water when you want it, where you want it, is the solution of the problem.

The I. H. C. gasoline engine can be used for other purposes beside pumping. It is a general purpose engine, which will be found an all around handy farm helper—to run grinder, sheller, separator, fanning mill, washing machine, churn, grindstone, etc. The I.H.C. line includes besides Famous pumping engines and jacks, the following:

Stationary engines, from 1 to 25 horse-power; Portable engines, from 2 to 20 horse-power; Skidded engines, from 2 to 8-horse-power; Tractors, 12, 15 and 20-horse-power, and Sawing and Spraying outfits.

Call on the International local agent for catalogs and all particulars in regard to these engines, or write nearest branch house.

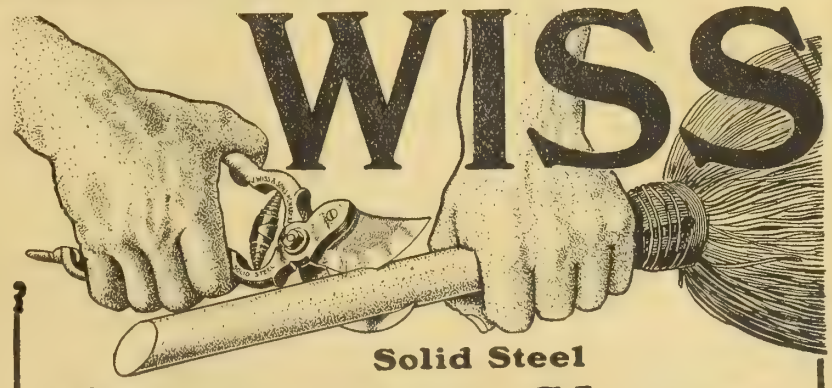
WISS



Solid Steel

Pruning Shears

Will Snip a Broom Handle

That gives you an idea of the strength and quality of the pruner. Wiss Pruning Shears will outlast a dozen ordinary ones. They will cut tissue paper. That shows how nicely they are adjusted.

Nurserymen and growers of fine trees use them in preference to all other shears—they will cut clean the thickest twigs or the most delicate tendrils without tearing.

Wiss dealers will replace free of charge any shears returned defective or unsatisfactory. All parts are interchangeable. If any part (say the blade) becomes worn, it can be replaced, thus making the shears as good as new at a slight cost.

Made in three sizes—9-inch, $2.25; 10-inch, $2.50. No. 3 B (7¾-inch) for light pruning, $1.75

Extra blades, 50 cents each. For sale by all dealers.

J. WISS & SONS CO., 15-33 Littleton Avenue, Newark, N. J.

THE BEST IN THE WORLD; HAS NO EQUAL

The Original R. I. Knapp Side-Hill Plow

Orchard and Vineyard Plow received first premium at State Fair

If you cannot get our plow send us the name of your dealer and we will see that you are supplied. Has given entire satisfaction for over thirty years. Equally as good for valley as hill sides. We manufacture five sizes—from one-horse orchard and vineyard plow, to the strongest grading plow.

Spraying for the Scab

The following was written by W. H. Volck entomologist for Santa Cruz and Monterey counties for a small bulletin which he issued to fruit growers of those counties.

SPRAYING with the Bordeaux mixture is a perfect remedy for the scab. Results from Bordeaux are certain provided the application is made in time. That is, the spray must be on the trees before the spores of the fungus have germinated. Under the conditions prevailing in 1906 Bordeaux applied in May along with the first coddling moth sprayings entirely prevented the disease, but this time of spraying was in many cases too late in 1907. The experience of that year has shown that in order to be sure of the scab the early attack must be sprayed for.

The early attack of the scab is prevented by spraying just before the blossoms open. If for any reason the trees cannot be sprayed just previous to the opening of the blossoms, apply the Bordeaux while they are in bloom. A few blossoms may be injured, but not to a serious extent.

The time alloted to the first scab spraying is short, and the orchardists should be ready to take advantage of it. A few of the blossoms will have opened and the great majority will be just ready to burst into bloom.

The Bordeaux Formula.

For the first scab spraying use 5 pounds of bluestone and 6 pounds of lime to 50 gallons of water.

Second Scab Spraying.

Two sprayings with the Bordeaux mixture should be given to insure good control of the scab, and then the apples should be carefully watched to determine the result. If any scabbing is noted a third application should be given.

The second spraying is applied along with the first application for the coddling moth, and the Bordeaux formula should be 3 pounds of bluestone and 4 pounds of lime to 50 gallons of water. If the first spraying has not been applied use the 5-6-50 formula.

The two sprayings above mentioned will control the scab on the Newtowns and most other apples. Pears and White Winter Pearmain apples should receive three applications—one when the fruit has attained the size of marbles. The Winter Nellis pear is very subject to the scab, and has not fruited well for several years, largely on this account. With this variety it may be well to give two sprayings with the Bordeaux mixture before the blossoms open. The first spraying should be just as the blossom clusters are unfolding, and the second as with other varieties, just before the blossoms open.

All applications for the scab, as indeed for any other kind of spraying, should be thorough. Spray the tops of the trees well.

Lime-Sulphur Solution and the Apple Scab.

There is considerable discussion concerning the possibility of controlling the scab with the lime-sulphur spray, and there is good evidence to show that it will prove effective. Perhaps one spraying just before the blossoms open might entirely control the disease. It must be remembered, however, that the use of this spray as a scab remedy is in the experimental stage, and the orchardists should go slow for the present.

For the purpose of scab control the solution should be used at a much reduced strength, from 1 gallon in 15 to 1 in 20 gallons of water. The lime-sulphur solution will do no injury to the trees when applied just before the blossoms open, but is likely to cause the falling of leaves if used after the fruit sets.

Caution.

The lime-sulphur solution should never be mixed with arsenate of lead. Such a mixture results in the decomposition of the arsenate of lead, making it very injurious to the trees.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Uusigned communications receive no attention.

Care of Orchard.

Kindly inform me proper way to care for young orchard, peach, apple and pear trees. It has just been planted this month. When should I spray? What ingredients should I use? Also give other information regarding general care. I am a beginner in this work in California.—Z., Nestor.

The best information to give the inquirer is to observe closely the methods of work amongst neighbors who have had experience with like fruits. The next step should be to buy the best book procurable touching upon the subject of orchard care. There will continually be questions coming up which cannot be anticipated in space at command to give the extended information requested. As to pruning the young trees we would refer the inquirer to the article which appeared in the Cultivator of January 14. But in addition to that there is sufficient to be learned to make a good sized book upon the subject of pruning. Spraying is done to subdue insect pests or as a preventive of fungous diseases. To mention each of these and give a remedy is to write another small book. First let the pruning of the young trees be thorough and intelligently done, then give the ground thorough culture in order to preserve the abundance of moisture which has been given us this year. If the trees were bought from a clean nursery, fungous and insect diseases should not be a factor with the first year's work.

San Jose Scale.

What is the matter with my apple trees? In cutting the bark I find brown spots running almost to the wood. I enclose sample of wood and bark.—J. H. S., Santa Ana.

The brown spots underneath the outer bark are simply caused by San Jose scale which have covered the

trees and inserted their sucking tubes through the outer bark. If you will make close examination of the bark, especially of the younger and tenderer twigs you will find them covered with little specks which are the mature insects of the San Jose scale. Spray at once with the sulphur and lime solution.

Flats—Whitewash.

The Q. A. L. article on planting tomato seeds was just what I wanted but what does he mean by flats? Please give formula for applying whitewash to fence posts. The Cultivator is a paper I cannot get along without. Have taken it now for six or seven years.—C. J. Barclay, Uplands.

By "flats," seedsmen refer to a small box the sides of which are made of 1x3 stuff, usually 18 inches long, and the bottom often of redwood shake. This makes the inside measure of the box or "flat" about 16x18x3 inches deep. A good whitewash is made by adding a fairly strong brine of simple salt and water to the whitewash made of lime and water. The salt "sets" the lime and prevents the rain from washing off and makes a very cheap and durable covering. The famous government whitewash of which so much is spoken, is made as follows: 2 pecks unslaked lime, 1 peck common salt, 3 pounds rice flour, ½ pound Spanish whiting, 1 pound clean and white glue, a sufficient quantity water. Slake the lime in a vessel of about 10 gallons capacity; cover it, strain, and add the salt previously dissolved in warm water. Boil the rice flour in water; soak the glue in water and dissolve on a water bath, and add both, together with the whiting and 5 gallons of hot water to the mixture, stirring all well together. Cover to protect from dirt and let it stand for a few days, when it will be ready for use. It is to be applied hot, and for that reason should be used from a kettle over a portable furnace.

Control of Sex.

I wish to learn how to select breeding pens of thoroughbred chickens to produce more cockerels from one pen and in another to produce more pullets.—H. L., Covina.

Our inquirer is asking what the scientific world has asked many times, a question which has never yet been satisfactorily answered. The controlling of the sex by various plans of mating has been attempted also by selection of different shaped eggs, but every such theory which has ever been tried has failed to work out when careful observations were made. There is no known way of determining or controlling the sex.

Value of Old Bones.

What is the value as fertilizer of old bleached bones ground into meal? What value as a fertilizer have the ground bones which have been covered for a long time with drainage from slaughter house, ground into meal? Would a green bone cutter make it fine enough for fertilizing purposes? —Subscriber, Corning.

The only way to get exact value where one has sufficient quantity to justify is to have analysis made. They are however without question well worth using if they can be pulverized. We doubt not, even buried at roots of newly planted trees, they would all be absorbed and taken up by the roots before many years. Many tons of valuable fertilizer have been made from old and bleached bones. Those which are saturated with the drainage from slaughter house would possibly have a little added value from saturation with blood and matter which carries a large percentage of nitrogen. As to using a green bone cutter, however, to accomplish results, we imagine one's time, if of any value whatever, could be better used to other purposes.

Cutting Tops after Budding.

In citrus nursery stock do you advise cutting the seedling back say four inches above the bud when it starts to grow, thus leaving the trees without any leaves; or would you only cut off the lateral branches, allowing much of the seedling stock to remain until the bud is well grown. Will not the root system develop better and the vitality of the tree be better preserved if part of the foliage is allowed to remain?—D. E. F., Riverside.

The theory which you advance is one of very common belief and is practised by some. Many nurserymen have followed the plan, instead of cutting off the entire top four or six inches above the bud, of making a slight cut on one side, then bending or breaking the tree over, allowing the entire top to remain but broken over so as to retard the greater flow of sap. The theory, as you advance, is that it encourages larger root growth. But these tops being in the way of cultivation, being such a trouble maker in handling the fu-

ARMSTRONG NURSERIES
ONTARIO, CAL.

The roof that proves: sun-proof and rain-proof; needs no paint or repairs.

Pioneer Rubber Sanded Roofing is its own best advertisement—answers every need, where a sun-proof, rain-proof roof is required. Write for samples—and beautifully illustrated booklet.

Pioneer Roll Paper Co. Department 11 Los Angeles, California

ENCINAL NURSERIES

SPECIALTIES: Franquette Walnut, grafted on Black Walnut root. Absolutely genuine.

Wonder Walnut.—New: The largest, most prolific, and youngest bearer known. Twelve nuts grown on a **one year graft** in nursery row, placed side by side, measure 22 inches; each measuring 5½ to 6½ inches in circumference. Thin shell, blight resistant. Fully tested for years. Limited stock of grafting wood and trees for sale.

F. C. WILLSON, Prop. Sunnyvale, Santa Clara County, Cal. Tel. 171

The Arnott Double Disc Harrow

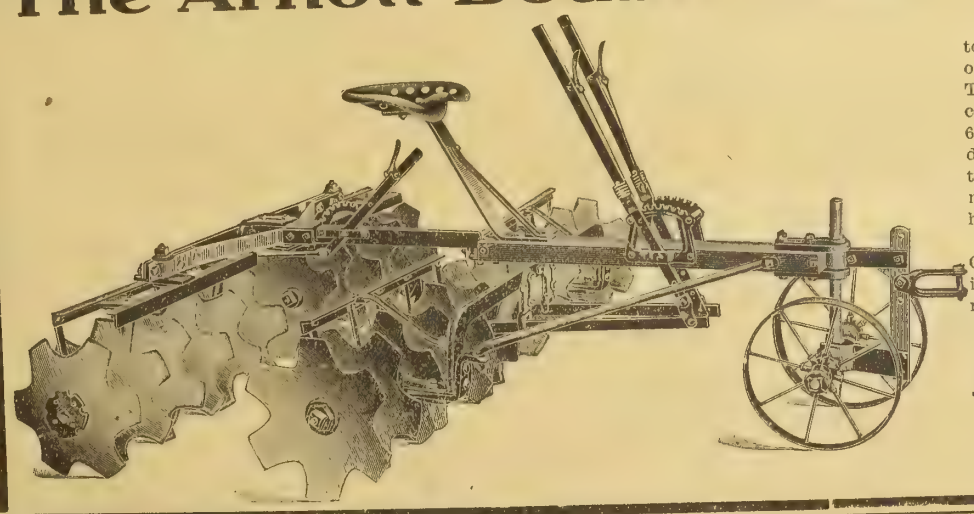

Illustration is given above of a new tool designed especially for California orchards and general field work. This consists of a combination of two cutaway pattern disc harrows, each 6 feet in width, each having 12-16 in. discs. The rear harrow can be detached by removing one pin. All harrows furnished with foretruck and 4-horse tripletrees.

Price f. o. b. Los Angeles $60.00. Complete descriptive circular showing several views of the harrow mailed on application.

REX YOUR TREES WITH
LIME & SULPHUR SOLUTION

The well known REX LIME & SULPHUR SOLUTION manufactured by the California Rex Spray Company, at Benicia, is no longer an experiment. Of the thousands of customers that used it last year, we have scarcely a single report but what is in its favor.

It is the best known insecticide and fungicide; is a tonic to the tree; is prepared on scientific principles; is absolutely uniform; every barrel that is made at the factory being of just the same strength, namely, 33% solution, Baume test; is free from sediment; is ready for use in the orchard without having to be boiled; one barrel of 50 gallons makes 600 gallons of the strongest spray, and is by far cheaper, at the reduced price at which it is offered this year, than any farmer can afford to make a home-made, imperfect solution.

Ask you dealer, or address:

CALIFORNIA REX SPRAY CO. Benicia, California
YAKIMA REX SPRAY CO. N. Yakima, Wash.
THE TOLEDO REX SPRAY CO., Toledo, Ohio.
THE REX COMPANY, Omaha, Neb.

Trees! Trees!

25,000 Grafted and Seedling Walnuts from best selected seed and grafts. 25 kinds of Peaches, clean and well rooted; 20 varieties Apples; a choice stock of Royal 'Cots; 4000 Satsuma and all other leading Plums; Oranges, Lemons, Grapes, Palms, Roses and Ornamentals. Anything in the nursery line. A fine, well assorted, clean and thrifty stock. My personal attention is given to selecting best buds, grafts, seeds and cuttings to propagate from.

Small Fruits and Vegetables

THIS MONTH.

EXTENSIVE plantings of early potatoes made this month in many sections. Early rose, early Ohio or other early kinds should be selected. Plant rhubarb, horseradish, asparagus and onion sets. Make liberal sowing of peas, beets, lettuce, turnips, carrots, radishes and spinach. Raspberries, strawberries and all other small fruits should be planted at once. Grapes and in fact all deciduous fruits can not be planted too soon.

Ground should be plowed or spaded for the later plantings of things of the more tender sorts. In making ready this ground a liberal spreading of well rotted manure will prove profitable.

ORIGIN OF THE TOMATO.

THERE are people now living who remember when the tomato was thought to be poisonous. It was called the Jerusalem apple and was kept on the mantel as an ornament. Boys in those days were warned against eating tomatoes, but seeing the birds eat them they soon found the birds knew what was good. The tomato is a native of Peru, but grows spontaneously throughout Mexico and as far north as Texas and California in a form closely approaching the cherry tomato of our gardens. It was introduced in Europe as early as 1561, and was eaten there dressed with pepper, salt and oil, much as many people eat it today. In 1597 it was grown in England, but used only for ornament for many years. In 1700 there is mention of seven varieties—one pale red, one striped, two yellow, one white and one red—but its culture was neglected, for in 1819 only four red varieties were mentioned. It was introduced in Philadelphia in 1789 and in Salem, Mass., about 1802. Its cultivation for the market began in 1829, but it did not find a place in the premium lists of horticulturist societies until 1839. In the earlier catalogues mention is made of a type called the "large red," which was followed in 1862 by the "Fiji Island;" in 1869 by the "Cook's Favorite," and in 1866 by the "Tilden."

Bulletin 117 of the agricultural experiment station of West Virginia gives the following information:

A. W. Livingston of Columbus, O., originated a great many good varieties, the first of which was the "Paragon." In 1880 he produced the "Perfection," and during the next ten years a number of other varieties. We had a call from Mr. Livingston in 1880 and were very greatly interested in his methods. He appeared to rely entirely upon sports. He bought seeds from the canneries by the tens of thousands, planted them and studied them, and when he found a sport that had the shape and color that he desired it was carefully preserved and propagated.

The wisdom of his methods has been shown by the experience of the various experiment stations. None of them have succeeded in making any great improvement through hybridizing. Both the Maine experiment station and Cornell university have endeavored to produce hybrids by crossing two species, but the result is that the hybrids are unstable and the fruit too small to be of any commercial value. As varieties run out, which they will do in the course of time, the quality can be kept up mainly by adopting Mr. Livingston's method of hunting sports. It is a rather humiliating fact that nature does in her off-hand way what man with all his science and skill is unable to do. A number of our best varieties of wheat are sports. The same rule seems to govern both in the wheat field and in the tomato patch.—H. M. Daly.

GARDEN PEAS.

From February till summer all kinds of peas do best. The complaint is general—we don't get enough. Your own fault. People who plant a handful of one or two kinds must expect only to get a few messes which will be tantalizingly as skimp as sweet. The way to get enough is to sow the kind you prefer every fortnight during February, March, April and May, or else to sow in February at the same time the three best early, medium and late sorts and as each in turn gets beyond maturity, replace the first to mature by sowing a late sort, the next by sowing a medium sort, and the last by sowing an early kind.

How to prevent the peas from rotting in the ground, you say? Don't soak them before planting, and don't put manure close to them.

A good time to plant them is several days after a rain has soaked the ground deeply. In lieu of rain, let the hose trickle down a furrow till its whole length is saturated. Make the ground loose and level with plow and cultivator or spade and rake.

Dig a shallow trench 3 or 4 inches deep, spade-wide, rake in a little of the loose dirt, scatter the peas all over the trench, on the average 2 or 3 inches apart, throw in a couple of inches of dirt and tread it down, rake the surface, and dust it liberally with wood ashes; the latter is to keep the birds at bay.

There should be no more need of attention till, if rain holds off, an irrigation is necessary, in which case a furrow should be drawn 6 inches away on each side of the stems and a trickle from the hose allowed to gradually soak the entire ground, the surface afterwards being broken up and raked or cultivated lightly to retain the moisture. If green fly (aphis) is troublesome, dust the young shoots with tobacco dust. If mildew threatens, spray or dust with Bordeaux mixture.—Pacific Garden.

"QUIT YOUR KNOCKING."

Put your hammer in the locker;
Hide your sounding board likewise.
Any one can be a knocker;
Any one can criticize.
Cultivate a manner willing,
Though it hurts your face to smile
And seems awkward in beginning—
Be a booster for a while.
—Oil Mill Gazetter.

New Aunt—So you are six years old, Edith. How old do you think I am?

Edith—I don't know. We haven't got that far in 'rithmetic yet—Harper's Bazar.

Mother—What's the baby crying for now?"

Elsie—Freddy was trying to make him smile with the glove-stretcher."

The Ornamental Garden

THIS MONTH.

FERTILIZE the lawn. If manure is used see that it is thoroughly rotted so that it will carry no weed pests into the lawn. Bone meal is fine for a lawn. True up the edges and seed in with blue grass or clover where bare or where weeds have choked out the finer grass.

Plant such bulbs as amaryllis, agapanthus, cannas, dahlias, iris, tuberoses and even the early gladiolus may be set. From now on gladiolus may be planted every two or three weeks for continuous bloom through the summer.

Pansies, stocks, verbenas, and salvia can be transplanted from seed boxes to the open beds.

All deciduous shrubs and trees should be planted at once.

Bear in mind spring is fully on us and perfection of bloom next summer demands early attention to the garden this month.

GOPHER AND SQUIRREL PROOF BULBS.

Many are the blessings that Nature has bestowed upon this privileged land of California, but, against them there are a few which we may politely call "the reverse."

Gophers and Ground Squirrels are at the head of the list, as everybody who has done any gardening in California will be ready to testify. And in many cases it will happen that the most petted and cherished plants are likely to fall prey to the rodents.

"Eternal vigilance" is the only effective treatment to be recommended, but, unfortunately, it is not always within the possibilities of everybody. In order to mitigate the evil I believe in making known to the public that there exist some plants which will never be touched by ground squirrels or by gophers, not even in the driest seasons when food for them is quite scarce. The statements which follow are based on my own personal experience on my grounds at Montarioso, which, being entirely surrounded by pastures and wild brush, offered an ideal abode to those pests, now diminished in numbers but far from being exterminated.

To speak only of "bulbous plants," a favorite food for squirrels, I have found to be entirely immune from them and from gophers:

Amaryllis Belladona, the "belladona lily."

Chlidanthus Fragrans, the "Peruvian daffodil."

Hemerocallis Aurantiaca Major, the "everblooming Japanese day lily."

Hippeastrum Aulicum and other kinds, known under the name of "scarlet amaryllis or lilies."

Hymenocallis Calathina, the "large Peruvian spider lily."

Hymenocallis Caribaea, the ordinary "southern spider lily."

Narcissus Orientalis, the "Chinese sacred lily."

Pancratium Maritimum, the "Southern Europe spider lily."

Further experience is sure to add to this list of "immunes,' and I shall be most grateful for kind information of other people's experience, which will also make possible to compile a list of gopher and squirrel proof plants other than bulbs.—Dr. F. Franceschi, in Pacific Garden.

General Frederick D. Grant tells this story: "I was booked to speak at a large dinner in a town, and the toastmaster felt it incumbent upon him to make my path as smooth as possible. He therefore spoke of my father and said that I strongly resembled him. This had the desired effect on the people present and they gave me their best attention. Although I spoke as well as I could, I felt that every one was disappointed in me, and I sat down with relief that it was over. The toastmaster rose and smiled at me. Then he said to the guests: "Ddn't I tell you he was just like his father? He can't speak worth a cent.' "

IN THE CALLA LILY GARDEN.

DIAGNOSIS.

Into a general store of a town in Arkansas there recently came a darky complaining that a ham which he had purchased there was not good.

"The ham is all right, Zeph," insisted the storekeeper.

"No, it ain't, boss," insisted the negro. "Dat ham is shore bad!"

"How can that be," continued the storekeeper, "when it was cured only last week?"

The darky scratched his head reflectively, and finally suggested:

"Den, mebbe it's had a relapse."—Harper's Weekly.

Minister's wife:—"Wake up! There are burglars in the house, John."

Minister:—"Well, what of it? Let them find out their mistake themselves."

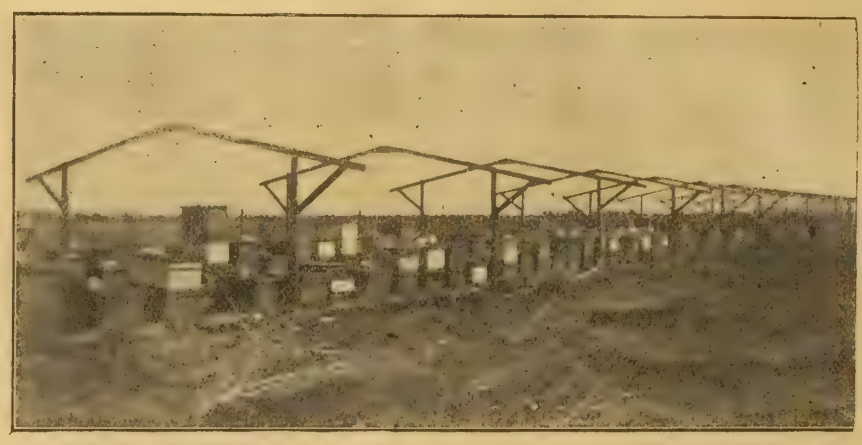
Bees and Their Care

THE APICULTURAL SITUATION OF IMPERIAL VALLEY.

SOME six months ago a certain fruit growers' journal of this coast reported that the season's honey crop of the Imperial valley would total up to about—well, so and so many cars, an enormous figure. I had visited the section in question at the close of the previous season, and from inquiries and observations made knew that that statement was largely overdrawn. But to make sure about it, I wrote out to a friend to let me have the truth about this thing. His answer was, that after everything would be gathered up into shipping shape, the total quantitative amount would just about come up to one-half of that reported. As the gentleman holds an official position in the Imperial Valley Bee Keepers Association his statement is reliable.

In 1907, and as many years previous to that as professional beekeeping had been carried on there, the output per colony of pure extracted honey of nectar in alfalfa blossoms is not as evident as in black sage, for instance, or better yet, the orange. Though, for some mysterious reasons a bee will visit perhaps a dozen orange blossoms before she loads herself down, when yet each single one held a good beeload of nectar. But the thing is different with the alfalfa proposition. Here a bee must needs visit a large number of cups to get a load at all. Still, if the alfalfa blossoms would keep pace numerically with the number of bees visiting them the thing would work out gaily enough on the principle of the more the merrier. But it's just here where the bronco balks. Alfalfa planting didn't keep up with bee planting, and, besides, the ratio of honey gathered altogether to honey available for the market undergoes a decided change with the more or less of colonies to the visible sources of nectar supply. If 100 colonies give a surplus of 5 tons on a given range 200 colonies may give 10 tons. But the probability is that they will fall short of giving 5 tons. For the constant brood-rearing going on, the large number of consuming youngsters in the hive, who do not, as yet, do any fieldwork, besides a thousand or two of gentlemen of leisure to each colony—all this swells the demand for home consumption enormously, reducing directly by that much the possible surplus for the market. And so the 2 case yield of '07 dropped in the Imperial valley in '08 to just 1 case.



Typical arrangement of Apiaries in Imperial Valley, 290 stands near El Centro. Two long rows facing opposite directions with 6 or 8 feet gangway. In summer the overhead racks are covered to shade hives and prevent melting of comb. This arrangement is not used anywhere else in the world.

was about 2 cases—240 pounds of amber honey. One man spoke of 2½ cases, and another of 3. There were not many bees there, then. The country was new, isolated and uninviting. Some enterprising man from the coast, seeking a sunnier clime than the San Diego hills usually afford during the spring months, happened to hear of the Imperial alfalfa fields and, thinking there might be a show there for his enchanting pursuit, ventured to ship a small lot of bees down. He located them in the alfalfa near Imperial town, and then awaited developments. And he didn't have long to wait. In fact, it wasn't a waiting game at all, but a most decidedly hustling one. The way those combs began to swell and grow, virginally white and clean, their precious contents glistening to the very edges of the miraculous cellwork, made—but what is the use describing the delicious thrill, none but your true beekeeper can ever hope to feel at that sight. Like a prudent man he kept the thing quiet. However, since there was plenty room for more, he gave the tip to a friend or two, still on the "outside." And those friends in turn tipped their friends. And so it came to pass that in 1907 the honey shipments of Imperial figured large in the section's agricultural statistics. And with that the cat was out of the bag. In 1907 the colonies of bees kept there numbered about 1000. And in '08 about 5000.

There are about 40,000 bees in a normal colony (so they say) during the working season. 40,000 multiplied by 5000 is 200 millions. The supply

Visiting El Centro last December, the officer of the Imperial Valley Bee Keepers Association spoken of above, informed me that in some localities the valley was greatly overstocked, while everywhere else there were as many bees as the situation could support. I was also told that several carloads of bees would be shipped out, back to the mountains of the coast, this winter.

I take this opportunity to clear up the apicultural situation of Imperial valley, as far as I can speak from personal observation and true report. It may save intending locators much trouble and expense, and, also, protect those already there from unwelcome incursions of strangers.—Henry E. Horn, Riverside.

BEE NOTES.

Honey should be stored in a cool, dry place.

Actual experience is the only way in which success can be attained in bee keeping.

It is said that Germany produces more honey than any other European country. She furnishes 20,000 tons annually.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

ALFALFA AND OTHER SILAGE.

THE spread of general information is very slow, or it would not be possible for any one to doubt the usefulness of silage or the ease with which the first crop of alfalfa and foxtail can be converted into valuable feed. This winter has been a tryout with us of silage as never before; during the long rain storms of the past month everything has had silage, pigs, mares, colts, as well as the calves and cows. The colts show great fondness for it and it does not seem to hurt them. The commoner ones were given it first and now the best colt on the ranch, Don McKenney, receives his share. Don has a celebrated father and a mother with a good track record and is to take the place, if he matures all right, of the present stallion Alan that heads the fast string. This silage is Indian corn as we have fed down to that in the silo. The top of the silo was sorghum this year, which also gave good satisfaction.

Cost of Filling.

The cost of filling the silo is governed in a measure by the size of the tools used. The larger cutter we had for the large silo had been sold during the years when we did not have enough cows to use the three hundred and fifty ton silo. The present cutter is good for the smaller silos but must be replaced if the large silo is used next year. The cutter is necessary if the silage is to be good, for without it is cut up the packing cannot be complete enough to exclude all air. Then in removing the silage for feeding, it is not possible to take it off smoothly in regular form. This is one of the hardest things at present to get men to do in any silo; they do love to dig it out in holes, and this is wasteful. The surface must be kept level or the loss from moulding is greatly increased.

Crops for the Silo.

The foxtail alfalfa in the spring and oats and peas to complete the filling comes in useful for summer feeding. Then plant a corn crop and it does not matter in the least if the silo still has some feed in the bottom. Put in the new stuff right on top of it. The only rule I know is not to put in less than five feet at a filling or it may not keep. Where labor is hired, it is best to make silage and feed it out, rather than to grow beets or other crops. The more the men can be bunched on a ranch, the greater the economy of operation, for then it is not necessary to watch them all over a large area. The cost of filling the silo varies greatly. The length of haul of the material and number of teams at work makes it figure out on the ranch all the way from the small cost of fifty cents a ton up to as much as two dollars a ton. Still when one is using foxtail alfalfa, which is something that must be cut and disposed of any way, the cost of making it into silage makes it pay well.

Foxtail.

This is the best grass in California for milk production, yet it is very harmful in hay. The horsemen around here rather prefer the alfalfa hay that has some foxtail in it, if it is cut early enough before the beards harden. This is very difficult to do, and as to what the horses think of the owner who gives them foxtail hay, deponent says not further.

Barley hay also has beards, and as horses cannot use tooth picks, the men should clean out their mouths every morning, particularly looking to the under part of the tongue. The best use of foxtail alfalfa hay is not to use it for hay making but to put it into the silo before the barbs harden. The importance of putting it in early is that the foxtail seeds are not dropped but go in green or in the dough stage. This then secures the full nutritive value of the seeds as grain in the feed. The mowers have the gatherer put on and the alfalfa and foxtail is discharged in a long continuous line across the field. Sometimes it is heavy enough not to require raking and can be loaded directly on to the wagons. If it is light, bunch it with the horse rake and haul at once to the silo. Cut the stuff into not less than two inch lengths.

Blowers.

In buying a machine for alfalfa, make the manufacturer give you a stiff guarantee that the blower will handle alfalfa and that the traveling table of the cutter will feed it. There are some makes that are fine for corn that will not handle alfalfa at all, other cutters that handle it too slowly for profit. Ask a guarantee with quick replacement if the machine does not cut and elevate the required tonnage per hour. We are running the elevator with our cutter and it does good work but will have to be replaced with a larger machine to meet the requirement of the increased herd of cattle. Alfalfa silage needs to be made very wet. A constant flow of water from a three quarter inch pipe is not too much to be constantly falling on the cut stuff as it goes up into the silo. Then tramp it well and make it firm all around the edges.

Experience.

Since 1896 we have been making alfalfa silage of the first crop of hay. It is a success and not an experiment, have no fear of trying it. Precautions to be taken are plenty of water on the stuff, tramping it well and filling six to ten feet at a time, leaving an interval long enough for the silage to cool down to a hundred degrees. While it does not hurt the nutritive value of the silage to heat up and turn black, as it will do if filled up at once, the cows do not relish it and though they do eat it, I do not like them to be dissatisfied with their food. Contented stomachs help milk flow. The use of salt in alfalfa silage is not good, as it does not add to its keeping qualities, and gives it a disagreeable taste. There is no use in salting any silage in the San Joaquin Valley, as the animals do not care for it. We do believe in having salt at convenient places

HONEST CAPACITY CREAM SEPARATORS

Capacity is an important consideration in the purchase of a cream separator. It enters largely into the cost and value of the machine, and there is no way of properly gauging either without reference to it.

A large capacity machine separates the same amount of milk in just so much less time. This saving of time means something in dollars-and-cents every time the machine is used. It means a great deal in the course of a month or a year. Moreover the wear of the machine is just so much less and it lasts that much longer.

But capacity must always be determined with CLEAN SKIMMING under the PRACTICAL, EVERY-DAY USE CONDITIONS,—with ordinary separator speed, cows old as well as fresh in lactation, milk cool as well as warm, and thick as well as thin cream. Capacity means nothing if any of these conditions have to be sacrificed to obtain it.

Hence capacity marks one of the BIG DIFFERENCES between the "ALPHA-DISC" DE LAVAL and other cream separators. The DE LAVAL machines fully meet these conditions. All other machines either lack the capacity "claimed" for them or can only reach it through sacrifice of one or other of the important practical use considerations named.

A DE LAVAL catalogue makes plain the reasons for this difference and is to be had for the asking.

IN THE LEAD

For **1909**

The 1909 Model U. S. Cream Separators

retain *all* features that have given them their great reputation for durability and efficiency, and have several improvements that make them even to a greater extent than ever before, the ideal machine for dairymen who are posted and who **demand the best.** And by intensifying the circuitous and tortuous currents of the milk in its passage through the separator bowl, we have been able to

Greatly Reduce the Diameter of the Bowls

which makes them operate easier than ever and still retain their great milk capacity.

Notwithstanding most manufacturers were complaining all last year of dull times and small sales the UNITED STATES SEPARATOR had one of the **largest sales** in its history and since this fall season began, sales are larger than last year.

Do not forget that the *United States* has *beaten* every separator in *endurance tests* and holds the WORLD'S RECORD.

No dairyman can afford to purchase a cream separator until he has first examined the construction and operation of the

1909 Model

Sales agents in nearly every dairy section. If no agent in your town, **write direct to us for Catalog No. 20** and we will also quote prices.
We have distributing warehouses in every dairy section in the United States and Canada.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7 in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 30 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ARNOTT & CO., 118 South Los Angeles St., LOS ANGELES, CALIF.

in the corrals for the cows to eat if they desire it, but do not force them to take it.

The foxtail silage is usually fed out in the summer time while the flies are bad and the heat is great. It is quite a saving to have the cows in a shaded pasture or lot and not out in the sun, tramping the young alfalfa to death. In the summer, if we can keep the cows quiet and cool, the milk does not drop down. The saving of the alfalfa field for another crop of hay is made possible while the cows are being fed the first crop preserved green in the silo.—M. E. Sherman.

PARALYSIS OF THE HIND PART OR AZOTURIA IN HORSES.

This is a disease which comes on suddenly and is due to an acid in the blood. It sometimes affects the front parts as well as the hind parts, and the animal may come out of the barn feeling fine, ambitious, willing to go, and often goes faster than usual, but before it has gone very far it begins to lose its speed, hangs back, sweats profusely, breathes hard, and begins to knuckle over behind, gets lame in one or both hind limbs and in a short time is unable to go any further, and often falls helpless on the road in a paralyzed condition.

The proper thing to do is to place him on a stone boat and haul him into the nearest barn, place him in a large, well bedded box stall or a barn floor where he can be turned over often until he is able to get up. Medicines should be given of a laxative nature and that will allay pain and counteract the acid condition of the blood. An injection of warm water should be given to unload the rectum of its faeces so that the animal can if possible urinate. If unable to do so, the urine should be drawn. A stimulating liniment or a mustard plaster should be placed over the hips and the body should be kept comfortably warm. The animal should be given plenty of drinking water with the chill taken from it, a very little, if any, feed should be given before he gets up, and he should be fed on bran mashes and a very little hay after he is up until a full recovery has been brought about.—By Dr. David Roberts, Wisconsin State Veterinarian.

A recent dispatch from Omaha announces that fifty thousand dollars was appropriated there by the American Hereford Cattle Breeders' Association to advance the interests of that particular breed of animals in the United States and a board consisting of three members was named to expend this sum in whatever manner they may see fit.

THE GREATEST JERSEY.

Adelaide of Beechlands 168699 is granted the head of the Jersey column as to production of milk and butter fat. This remarkable cow is the property of the Ladd Estate, Portland, Oregon. She was dropped March 16, 1902, and for the 12 months ending Nov. 24, 1908, she produced 15,572.1 pounds of milk.

Her average percentage of fat for the year was 5.456, and the fat is equivalent to 999 pounds, 8.9 ounces butter, 85 per cent fat. Her yield averages per month 1297.7 pounds milk, 70.8 pounds fat, and 83.66 pounds, 83 per cent butter, and averages per day 42.55 pounds milk, 2.32 pounds fat, and 2.74 pounds, 83 per cent butter, for the entire year.

DIPPING SHEEP IN ARIZONA.

DRINKING MILK.

There is a right way and a wrong way to drink milk, and the great majority of people drink it in the latter way, says a writer in Dairy of London in a recent issue. That is the real reason why milk disagrees with so many people; at least it is one of the chief reasons. Milk contains all the elements necessary for maintaining the physical health of those who know how to use it properly. Indeed (says a writer in "Health") most people would be better off physically if milk and entire wheat bread formed their ordinary diet. Especially is this true of delicate persons whose powers of digestion have become enfeebled. Persons suffering from nervous prostration are not able to digest meat, and will find great benefit from a purely milk diet, but the milk must not be imbibed

like draughts of water—it must be sipped slowly, a teaspoonful at a time. There is a scientific reason for drinking milk very slowly, and in very small quantities. It is this: Milk curdles as soon as it comes in contact with the juice of the stomach. If a long draught of milk is taken into the stomach, the result is a large curd through which the gastric juices cannot readily penetrate and act with solvent power.

A small sip of milk makes a tiny curd, so if a tumbler of milk is taken sip by sip, it will readily be seen that the results will be a number of little curds, each one of which can speedily be acted upon and digested by the gastric juices of the stomach.

Where special nourishment is desirable, as in the case of very weak persons, or convalescents from wasting diseases, beef and wheat peptones may be added, or some one of the infant foods which are known to be absolutely free from starch.

It is unwise to add starch foods like farina or arrowroot or cornstarch to the milk for weak people or invalids, under the impression that the foods are very delicate and easily digestible, for they are, on the contrary, very difficult of digestion. Milk alone is far better for persons who have weak digestive powers, but the one great need which must be impressed on everyone is the need of drinking slowly and in very small sips with intervals between the sips. In nine cases out of ten, milk taken in this manner will agree with people unless there is some fault in the milk.

Water may be taken in long draughts without danger, provided the system is not weak and overheated by running or other exercise, but milk should always be imbibed slowly.

CONTAGIOUS ABORTION IN COWS.

A radical change has been brought about concerning contagious abortion in cattle. The time has been when stock owners whose herds were afflicted with contagious abortion did everything in their power to keep the fact from becoming known to the public and in order to be successful in doing so they would avoid conversing with other stock raisers on this subject, and I dare say in this way were handicapped in obtaining valuable information as to how to positively wipe contagious abortion out of their herds.

Their reasons for keeping this disease in their herd a secret was that they knew very well that no intelligent or well posted stockman would think of buying stock from a herd afflicted with contagious abortion, and I want to say that the stock raisers of this country are becoming so well posted and well educated along this line that they are protecting themselves with this knowledge and will not consider the purchase of animals from a diseased or afflicted herd.

The time has now come when bright, well posted and successful stock raisers discuss the subject of contagious abortion in cattle freely for the reason that most of them have already had experience with this dreadful disease and have obtained information and have learned that it can positively be wiped out, consequently they have no fear of the disease, nor have they any fear of telling their friends that they have had it in their herd, but have wiped it out and are perfectly willing to advise those who desire to obtain information as to how this can be done.

The knowledge concerning contagious abortion in cattle has been spread throughout this country by the successful stock raisers. They have not only done this in the past, but are doing so at the present time and by so doing, they are building up the reputation of our live stock industry, thus increasing the value of each animal, as it is reasonable to expect that a strong, healthy, money making cow ought to be worth more than two ordinary afflicted or suspicious ones. I am sure that if this offer were made to any well posted stock man that he would prefer the one cow with the clean bill of health attached, to the two suspicious cows unaccompanied by the bill of health.

I feel that it is a privilege and it should be the duty of every stock owner in this great progressive country, to at least see that his animals are free from contagious or infectious diseases, such as tuberculosis and contagious abortion.

The moment that these two diseases are wiped out of our herds, the more valuable our stock will become, the more saleable they will become. They will be sought for by other people who are less careful concerning the health of their stock. It matters not so much as to what breed of stock but it matters much as to how free they are from disease and as it has been said before, it is within the power of every stock owner in the world to own healthy stock. This being true I will close by asking the question, which is the most profitable, healthy or diseased stock? Be fair with yourself and instead of answering me answer yourself.—Dr. David Roberts, Wisconsin State Veterinarian

COMPARATIVE VALUE OF BEEF BREEDS.

If the values obtained at such representative sales as those of the various beef breeds which have been recently held at the Chicago International are indicative of their relative value as producers—and no impartial judge can say that such is not the case, as it is claimed for these sales, both by the management and the breeders themselves, that the individuals offered are good representatives of the respective breeds—then there can be no doubt but that the Short-horn breed of cattle, animal for animal, is the best investment, as well as the most popular of all the beef breeds.

A comparison of the values obtained shows the Short-horn in the lead with an average of $403.70 per head, the Aberdeen Angus with an average of $209.50, and the Herefords with an average of $160.00.

Riverside and Santa Ana are somewhat concerned over the building of a reservoir at Fillarie Flats which is to be used for impounding storm waters. Riverside has appealed for the privilege of distributing this water over waste land which is a feeder for the water systems of both Riverside and Santa Ana and does not desire the impounding of the storm water before it reaches these flats.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

EDUCATE TOWARD AGRICULTURE.

In a personal letter to the office regarding her accompanying a committee to the State Capitol to urge the passage of a bill for the establishment of the normal or teacher training school at Fresno, Mrs. Sherman referred to the fact that many of the teachers in that section of the state are not fully trained teachers, many of them having only county certificates with most meagre preparation for actual training of young minds. Especially is the lack of knowledge of the science of agriculture noticeable by its absence in these teachers.

Mrs. Sherman's plea was for the education of more teachers along agricultural lines and used as one of her arguments that the State School at Davis of which so much has been hoped has been able to draw to itself only 25 pupils at its opening session. It is possible this indicates the desire of the state as being away from rather than toward agricultural education. If it really does this, then early steps should be taken to correct it, for we believe the welfare of the race and especially of this state, will depend largely on qualified workers who have to do with its agricultural life. If the desires of our young people lead them away from the farm, should the matter not be treated as we treat the matter of morals? Their desires sometimes seem to be in another direction or at least enough perverseness appears in their make-up to make it so appear. Regardless of their desires they are trained along lines so far as is possible which may be contrary to their inclinations. This should be true as to agricultural training. For surely it is recognized that in this state there are openings for our young people in agricultural lines if they will but fit themselves for such work.

This may best be done not in special agricultural schools but in the public schools in which they start as little fellows, which should in every year of its course train their minds to observe the various processes and growths which are taking place about them on all sides. This education surely cannot be given without we have qualified teachers. The Normal School we have in Los Angeles, and possibly others in the state, is giving a limited amount of agricultural training to the young people who are taking the normal work. Bear in mind we say limited, for according to our needs it is exceedingly limited.

Regarding this matter of education the Country Life Commission when in California recently were asking questions of those who appeared before them, and Prof. Bailey asked a leading educator, "What is the aim of the ordinary teacher of the country school?" The question quickly brought the answer, "Either to secure advancement to the city school or more often to get married." Our country schools must offer better inducements as to salaries so that teachers will fit themselves to be country school teachers instead of making it a stepping stone to the city schools.

VALUE OF AN EXPOSITION.

Nothing could have attracted so much attention to the great Inland Empire which centers at Spokane in eastern Washington, as did the magnificent apple show which was held there the last fall. At that exhibition, premiums were offered aggregating $35,000 and the entire cost was something over $85,000. But this liberal handling of such an exposition, one of the items of which was the offering of $1,000 for the best single apple exhibited there, has succeeded in attracting much attention to that industry. Much, not only in an advertising way, but in the way of compelling the asking of the question, "What are the requirements for perfect fruit and how may we produce fruit which will command a premium either at such an exposition or in the open market?"

California needs just such an awakening as would come from a similar exposition. For instance, if the citrus growers of the state would combine and offer large premiums and bring together the best fruit which can possibly be produced along citrus lines there would be such an awakening of a determination to produce just such fruit as would immensely increase the wealth of the future output. Citrus fairs of the past have more largely catered to general display and to emphasizing the fact that fruit could be produced in large quantities, and great taste could be shown in its arrangement. Now let us have a display of fruits which are placed in competition with each other purely on the merit of individual fruits or of collections of fruits, on a quality basis.

This is not addressed to citrus growers only but to many other producers in the state who may be equally in need of encouragement. We believe that with Watsonville as a center an apple show could be put up in California which would be the equal of the famous apple show of Washington.

The grain growers are learning that there is grain and grain. Samples of wheat grown by Prof. Shaw at Davis show great variation in quality and quantity. Let us get together and learn which is best and why it's best.

KEY TO THE SITUATION.

As a lesson for the orange growers of Florida the Jacksonville Semi-Weekly Times Union in a recent issue taught a good lesson on co-operation in a cartoon as to the situation in Florida and in California. The main part of the picture was a closed door, which was labeled "Prosperity." Before it stood three Florida orange growers, hands in pockets, all with very downcast expressions. The large key to the door of prosperity which was labeled "Organization," hung on a nail out of reach of the three orange growers. In the upper corner before a reproduction of the same door stand three California orange growers. But these three California growers have climbed on each other's backs, one supporting the other, the top one taking down the key labeled "Organization," and they are ready to unlock the door of "Prosperity." This is labeled "California's method." "United we stand, divided we fall." The Californians are saying "We got it," while Florida is mourning, "How did California get it?"

Now this is not mentioned to make comparison between the two states. Florida is making strides along the same line but may well learn of the California orange growers who have stood together for many years and are winning as a result of their co-operative efforts. But we may use it as an argument with some of our other producers in this state. Prune, raisin and other producers have attempted organization but too often have thrown down the whole proposition because of some fault or fancied fault in the plan. This lesson of standing together or being united in the effort to maintain a common interest is the only way success will be secured. If such an immense industry as is the citrus can be held together, certainly the others will find no greater difficulty if they will but observe the same wisdom which citrus growers have.

ARIZONA.

Arizona has long been considered as being strictly a frontier country. For an expression for anything wild and wooly, Arizona seemed to be sufficient. And indeed there are thousands of acres within its border of such a rugged and forbidding aspect that one traveling through the territory over the ordinary lines of travel is possibly justified in the impression that within its borders there is little of worth and much that is crude. But more and more the news columns and market reports force upon us the truth that with all that she has of a forbidding aspect Arizona is still at the same time producing wonderful results in some of the little nooks and corners where conditions are right to prove her productiveness. The earliest of oranges, amongst the earliest of the melons and some other garden truck, have been sent to the Eastern markets. There have been many failures like the endeavor to produce strawberries, but these failures are gradually weeding out those things which they prove are not suited to climatic and soil conditions. The best part of it is that those things which are proving productive are proving wonderfully productive and profitable.

This material advancement coupled with the dignity of statehood which will probably soon be given her will bring this section more and more to the front and prove her to be one of the great factors in the development of our rich country.

MELON CULTURE.

The wonderful profits which have been made from culture of cantaloupes in Arizona and in many sections of California, and the interest created in the industry make the article on first page of this week's Cultivator, by Prof. Forbes on that industry of particular interest at this time. It relates more particularly to the growth of this product under the extremely arid conditions which prevail in Arizona, but there are points in it which will be instructive to cantaloupe growers in all sections. The article has been in hand for some time but has been held until this time, when we feel the greatest interest will be conserved by its publication.

There was a wisdom and a culture in the spirit of Lincoln higher than any outward education could have bestowed. It was this inner beauty, not the outer homeliness, that was the real Lincoln.

The Lincoln Farm Association has already gathered $200,000 from a hundred thousand people for the purpose of purchasing and preserving for all time the birthplace of Lincoln.

Agricultural Notes of the Pacific Coast

Northern California

Butte county paid $845 for coyote scalps last year.

Much bottom land about Chico will be injured by the deposit of sands from the recent floods.

The town of Knights Landing in Yolo county, was well under water during the highest part of the recent flood.

The Sacramento Valley Sugar Company at Hamilton anticipates the longest run on sugar beets it has ever had.

Two bills appropriating $88,000 for the new agricultural high school at Davis have been introduced in the State Assembly.

State Master Griffith of the State Grange has returned to his home in Santa Rosa after attendance at the National Grange.

Railroad communication between Sacramento and many points of the North has been resumed after long interruption due to the flood.

An officer of the Alameda Sugar Company reports that the outlook for an extensive planting of sugar beets and of excellent quality is good.

When the Iron canyon irrigation scheme is carried to completion 100,000 acres of additional land of the Sacramento Valley will be brought under cultivation.

The Humboldt Creamery Exchange protested in vigorous resolutions against the passing of a bill requiring the pasteurization of cream before its manufacture into butter.

The Ukiah Times is making a strong fight for growing better apples in that section, maintaining that some of the best apples in the world can be grown in Mendocino county.

To correct the abuse which has sprung up by so many milk dealers claiming that they have "certified milk," a bill has been introduced in the State Legislature providing that no milk shall be sold as certified unless approved by a county milk commission.

The present effort to secure a big appropriation for the building of a pavilion on the State Fair ground at Sacramento has stirred up Marysville and she proposes to donate land for a state fair ground if the legislature will authorize its removal to that city.

A new scheme of protecting the levees in some of the flooded sections this year was to string the sacks in which the sand was placed on a stout wire to prevent their being washed away by the current. As many as forty sacks were threaded on one string of wire.

Progressive Grange of Healdsburg recently elected officers for the coming year as follows: Master, J. T. Donald; overseer, G. H. Brigham; lecturer, A. E. Burnham; steward, George Mackey; assistant steward, Edwin Kent; chaplain, Mrs. W. E. Foster; treasurer, Sarah E. Keyes; secretary, Emily L. Burnham; gatekeeper, H. M. Keyes; Pomona, Mrs. Alice Goddard; Flora, Della Miller; Ceres, Helen Mackey; lady assistant steward, Mamie Foreman; organist, Julia C. Brown.

Central California

Hanford has a new industry in the shape of a pumpkin flour factory.

Berries and cherries at Prunedale, Monterey county, are beginning to blossom.

Twelve hundred dollars per acre is the latest sale price made by Porterville orange groves.

Several packing houses at Hanford are running full force on stemming and packing raisins.

The Miller & Lux lands in San Joaquin valley are to be subdivided and sold off to actual residents.

The Orchard Irrigation Company at Campbell, Santa Clara county, has reduced its charges on water from 75 to 25 cents per hour.

A new eucalyptus company has been organized at Visalia with a capital stock of $50,000, of which $3 has actually been subscribed.

The promoters of the Los Gatos flower festival are making an effort to secure the Liberty Bell for exhibition at the time of the festival.

Fresno county fruit growers are taking notice that the New York Dried Fruit Association is endeavoring to secure lower duties on dried fruit.

Since the storm and the recent cold weather the price of potatoes has been advanced. It is reported that one Jap in Fresno holds over 200,000 sacks.

Planting of new grain for next year's output over the San Joaquin valley is reported to be probably 25 per cent larger than that of last year's planting.

Orange county cabbage will be ready for shipment by February 15.

The organization of the Farmers Union is spreading all over the San Joaquin valley.

One raisin grower has secured a room in Sacramento and disposed of his raisin crop direct to the consumers, selling so as to bring to him five cents per pound.

Farmers of San Joaquin are watching the efforts in the State Legislature to secure an amendment to the Cartwright law more favorable to farmers' associations.

The raisin growers of Fresno are contemplating the introducing of a large number of Italian workers in the vineyards, one contractor agreeing to supply 500 husky men at $25 per month and found.

Messrs. Stubenrauch and Pomeroy of the Department of Agriculture have made observations this season in the Tulare county citrus shipping section which will aid in the future shipping and better keeping of fruit.

A resident of Fresno investigating the raisin condition in Kansas City stores, found California raisins in only six out of 36. The high prices of the raisins were the grocers' reasons for not handling them.

John Fairweather, who was at the head of the recent raisin growers combination which failed owing to running up against the Cartwright law now favors a regular corporation of raisin growers, the producers to hold at least 65 per cent of the stock of the company.

Southern California

Some Imperial winter-cut alfalfa hay totaled over a ton to the acre.

A $20,000 packing house is planned for Bryn Mawr, San Bernardino county.

It is thought the total shipment of celery from Orange county this year will not exceed 1500 cars.

Beaumont has had the greatest boom in orchard planting this season of any year in its history.

Imperial has begun its shipments of celery. It is estimated the crop from the valley this year will net $90,000.

Riverside Chamber of Commerce has a committee investigating encouragement to a proposition to manufacture orange wine.

A new walnut growers association has been formed at Orange and will be known as the Richmond Orange Association of Orange county.

Bee Inspector Pleasants of Orange county says the recent rains give almost positive assurance of a good honey crop in Southern California.

The celery growers have been pleased with the absence of blight this year, because with as much rain as has been given much concern was felt.

It is now predicted that the shortage of planted peanuts this year in Orange county will cause the closing of the peanut cleaning plant at Tustin.

First car of cabbage out this year from the Fullerton section commanded $34 per ton. That looks different than the $5 price which prevailed last year.

The present prices of potatoes will place the fortunate grower who held his spuds in the class of the "predatory rich" but unfortunately the Japs seem to be the principal holders.

Report from Washington says that California citurus producers must face a reduction on the tariff on oranges and lemons. Rumor has it that this reduction will be ten per cent.

The shipment of oranges after the recent storm was so heavy that prices eased off somewhat, but the rains coming again have held up shipments so that present indications are good.

A settler who had filed upon land in Imperial valley which is now covered by waters of the Salton sea has been denied entry because land covered by water cannot be granted to be desert land.

C. E. Utt, the peanut king of Southern California, says he has had all the experience he wants in competition with Japan for he has found peanut growing in face of such competition unprofitable.

A large number of quail captured in the Coachella valley will be released in Griffith Park, Los Angeles, and other sections of the country to stock them up with this game. The work is under the control of the State Game and Fish Commission.

"Sunkist oranges and lemons" is the latest catch phrase adopted by the California Fruit Exchange. It sounds good but the looks of it should induce some Cultivator subscribers to send in some more euphonious and catchy-looking title for the Exchange to use.

The Coast

Farmers at Morgan, Utah, are planning for the establishing of a cheese factory.

Northern Colorado territory shipped more than 12,000 carloads of potatoes last year.

The Oregon short line will furnish a Farmers Institute train for farmers in southern Idaho.

Yakima onions are now quoted at Seattle at 3½ cents per pound, with potatoes commanding $25 per ton.

A wool sale of 1,500,000 pounds recently was made at Helena, Montana, for 20 cents per pound, or a total of $300,000.

Utah State Agricultural College has over 800 students registered, of whom 300 are taking the regular agricultural course.

A company has formed at Le Grand, Oregon, with a capital of $600,000, which will irrigate 20,000 acres of land.

The Lynn County Fair Association at Scio, Oregon, plans an extensive enlargement of its grounds before next fall's fair.

An effort is being made in the State Legislature of Oregon to remove the state fair from Marion county to Portland.

A new irrigation project at White Bluffs, Washington, will bring nearly a thousand acres of sage brush under intensive farming.

Lands on the Sunnyside Canal in the Yakima valley, Washington, are promising the heaviest crop the coming season they have ever given.

The storm which covered California in the last few weeks gave an immense fall of rain to the western parts of Washington and Oregon.

Quite a bunch of hops has been sold at Salem, Oregon, at eight cents a pound. Other and larger lots at Portland have been sold at 7½ cents.

At the annual meeting of the grange at Albany, Oregon, recently, an election of officers and hearing of reports was followed by a banquet.

Weiser, Idaho, claims to have the largest sheep company in the United States in the Butterfield Live Stock Company with a capital of $150,000.

Apple growers of Oregon are continuing their emphatic campaign against the change in the size of apple boxes as proposed by a bill introduced in the National Congress.

Coyotes near Gresham, Oregon, are destroying large quantities of young stock and farmers maintain that unless relief is given stock farming will have to be discontinued.

China pheasants which were released at Albany, Oregon, have been found to be unable to stand the severe weather, many having been killed during the recent cold snap.

Gov. Mead of Washington recommends that a horticultural law be passed calling for the election of county horticultural inspectors instead of their appointment as at present.

An immense delegation with special train will go from Colorado farms to the Dry Farming Congress at Cheyenne, Wyoming. The governor of Colorado will accompany the train.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

THE FIRST INCUBATOR.

It is ready to work at any and all seasons; the oil to run it costs less than the food for hens doing the same amount of work; there is no trouble from vermin; broilers can be produced early without interrupting biddy when laying her highest-priced eggs; the care of the incubator is less work than that of the hens to do its work, especially during the inclement season, and is more agreeable. These are some of the arguments in favor of the incubator.

On the other hand, a reliable hen will produce fewer cripples, and perhaps have better success if the eggs happen to not be perfectly fresh; yet on this point science is making rapid strides.

Notice that I say a reliable hen. But these are rare. The average hen will not be better than the incubator while many fall far below the machine in results.

If you contemplate placing it in the barn, or some other out-of-the-way place where it will be subjected to extremes of weather and little care—don't get it.

But if you have a dry and well-ventilated room with a temperature of preferably 60 degrees and not lower than 50 degrees at any time, and are willing to give it a reasonable amount of care, the investment will pay, even if you do not want to raise more than a hundred chicks in a season.

A cold room necessitates running the lamp at the highest notch and doubling the expense of oil; besides when the eggs are aired they become chilled too suddenly and too much. If there are extremes of temperature the regulator and lamp will require very close watching.

While it should not be necessary to sit up nights with the incubator, neither is it wise to treat it like a clock—to be wound up once a day and left to itself for the remainder of the time.

A cellar is apt to be damp and lack ventilation. A chamber, makes too much running up and down stairs. If possible have it in a room adjoining the one where the work is done.

Good results come, if the kitchen is large enough, by placing the machine in one corner. Many successful poultry women give it a place in the living-room; and even the parlor may be used, as there is nothing unsightly or untidy about the work save the day or two during the hatching process; and then the interest makes amends for the temporary disorder.

Before buying, secure catalogues from several reliable dealers, study carefully the claims of the manufacturers, and your own requirements.

Avoid the cheapest machine of any make. As a rule it is so small that it is difficult to secure uniformity of temperature in the egg chamber.

The nursery—an important adjunct, is usually lacking in the smallest machines. If one of the largest size is chosen, it will be found cumbersome; it requires too long time for filling if your own eggs are used; if the hatch happens to be a poor one your loss is that much greater.

A machine of about 100-egg capacity is large enough for the beginner, contains all essential conveniences, and one can later increase the capacity if success attends the humbler effort.

Study both directions and machine thoroughly before starting the incubator. Have it on a firm, level foundation, and remember that good ventilation and avoidance of draughts are as necessary to the chick in embryo as to the human being.

The experienced hand always runs an incubator a day before filling, to make sure that the parts are working properly. The novice with a new machine should not feel it time lost to wait until three days after she has learned to control the heat at or about the required notch. The germs are especially sensitive during the first few days, and undue heating will ruin the entire hatch.

The fresher the eggs, the larger the percentage of chicks. Never use those over two weeks old, and two days is much better.

Gather often enough to avoid chill, keep in a room with the temperature never lower than 45 degrees nor higher than 60 degrees. Pack firmly in a box, using regular egg filler or wrapping each egg in paper. Turn the box carefully over every day, to prevent the yolk adhering to the shell.

A specialist says that twelve hours before filling the machine the eggs should be stood on the small end, balancing the yolk and locating the air cell in this way.

Fill the incubator in the morning. Putting in cold eggs will run the thermometer down so that it will be several hours before the heat is up again, and you want time before night to be sure that all is properly adjusted.

Select medium-sized, shapely eggs. Avoid all the abnormal forms, of thin shell. Do not crowd or pile one on top of another.

If you desire to replace the infertile ones which will probably be tested out, give eggs to a sitting hen at the same time. As many of these can be used after the first testing as are necessary to fill the tray.

Follow the directions closely as to temperature. If the heat should run too high, take the tray out and air the eggs, seeing that the egg chamber is cooled down to the normal temperature.

An excessive temperature and absence of moisture are doubtless responsible for chicks dead in the shell, the shell being rendered harder and the membrane tougher.

But this subject is not yet fully understood, and the novice can only adhere to directions, remembering that each manufacturer knows better what is the best way to manage his machine than any one else.

When the first test is made, there are some eggs about which the beginner will be doubtful. Mark each with a question mark and return them for later examination; but be sure to

keep the bulb of the thermometer on one strongly fertile.

The internal heat is so much that if the bulb happens to rest on a weak or dead germ the others will be raised to an extreme temperature before the deficient one registers properly.

Sometimes these doubtful eggs turn out all right. An expert would know their value at once; a second test will make it manifest to any one. Reject all clear ones.

Sometimes the air cell is on the side instead of the end, and not at first located. An expert can tell by handling them, which are the fertile eggs; you must expect to use the tester.

Use a good quality of oil. There is less danger from gas, and as it lasts longer it really costs no more in the end, giving always better results.

Trim the wicks every day, and attend to the lamp with as scrupulous care as though it were to grace the parlor table. Much depends upon its

A PRIZE WINNING BARRED ROCK

perfect work. Give it the best possible chance.

It is better to fill in the afternoon; then one is sure that through the night all will be well.

Authorities differ as to how often eggs should be turned. It is safe to follow the rules which accompany your machine. Assume that any reliable manufacturer will know and tell you how his machine does the best work. He wants it to succeed.

Many who have used both, prefer the hand system of turning the eggs. It certainly requires little work to take the tray out and place one end slightly higher than the rest.

Then remove the row of eggs on the lower side, gently turn the rest half over, to fill in the space just vacated, and last put those taken out into the upper side of the tray. They will be aired during the process, yet there is no rude jarring or danger of breakage.

An electric attachment for warning when the temperature runs beyond the danger limit gives good results and removes much care.

March eggs are less fertile than those laid later; but the chicks are vigorous, and do not have the hot weather and lice which often prove a menace to the later flocks.

Though you fill the incubator with fear and trembling at the thought of taking so many little lives into your hands, regular care and common sense will reward the efforts.

A good incubator will soon pay for itself, and will give a larger percentage than the average hen.—American Farm World.

Just Write Me a Postal for My Price and My Free Book

THE CORNISH FOWL.

WE are glad to give a brief description of the Cornish Fowl, an old breed with a new name, one of the most practical and handsome of all our standard breeds of poultry. Something like 35 or 40 years ago, this breed was imported into this country by a number of eastern breeders and bred very extensively for a number of year. In fact at that time they became very popular and many predicted they would lead the old stand-by, the Plymouth Rock, in popularity, but for some unknown reason, these birds were allowed to go unnoticed and were bred by less careful and painstaking breeders until they were very leggy and on the game order. This prejudiced many people against them and they gradually lost their popularity, not from the fact that they were not practical as they were bred, but many being prejudiced against a bird with a gamy appearance. At that time they were called the Cornish Indian Game. This name also prejudiced many against them, but during the past ten years, a number of careful and painstaking breeders have taken up this breed and have been breeding for utility and practical points as well as fancy. They have bred them broader with shorter legs, in fact, as they are bred today, they are the most practical or what is known as the best all-purpose fowl of any of our standard varieties. A well-developed bird of this breed carries more white meat than can be found on any other breed.

During the last ten years, in England, in competition with all breeds as a table fowl, they have won more prizes than all other breeds combined. They with the cross with the Dorking are about the only bird that has been able to carry off prizes as a table fowl.

During the past few years, if you care to look up the record of the large eastern shows, you will find this breed much in evidence. Also this season, the popularity of the Cornish fowl on the Coast has been a surprise, even to their fondest admirers. The Cornish Club of America was organized some years ago with the determination to bring this breed into prominence and put them again into the front rank where they belong. One of the first things this Club did was to change the name, dropping the word "Game" and the bird is now known as the Cornish Fowl and is bred in two varieties, the white and the dark. The standard for this bird is, Cocks, 9 lbs.; Cockerels, 8 lbs.; Hens, 6½, and Pullets, 5½, yet we have seen many of these birds weighing eight to ten pounds in the females and ten to twelve in the males.

When birds can be grown of this size, with as rapid growth as they make, there is no reason why the farmer should not take hold of them for the practical as well as a fancy fowl. We have known cockerels to weigh nine pounds at eight months of age. This, we believe, is ahead of any other breed. They are great foragers and if given an opportunity, will find most of their own feed. They are very hardy and the meat is very firm and any one must see this bird to appreciate the good qualities.

Last year was the first year that the Cornish was much in evidence at Coast shows. Again this year they proved to be our largest and strongest class, at such shows as Oakland, San Jose, Santa Barbara and Los Angeles. Among the more successful breeders and exhibitors of the Cornish Fowl, not only on the coast, but in America, is Mr. Alex. Aikman of Los Angeles. This gentleman has been a breeder of this variety for several years. His attention was first called to them as a practical fowl for the fancier and the utility breeder. At that time he purchased a pen of the best he could buy in this country, but after breeding them several years very successfully and giving close study of their characteristics, he decided he did not have just the proper thing in the Cornish. He therefore imported from Wm. Brent, of Cornwall, England, the best birds that he would sell. This importation consisted of 24 birds and included birds that had won prizes at England's largest shows and were pronounced by many competent to judge, as being the best collection of Cornish fowl ever imported by any breeder into America.

Perhaps no importation created more talk among the breeders than these 24 birds. Many predicted that Mr. Aikman could not breed birds that would be as good as the original

or parent stock and claimed that they would be a disappointment as breeders. The writer has had the pleasure of a visit to his yard several times, has handled his young as well as old, and he can say that he never handled a better lot of young birds than is in Mr. Aikman's yard today. He has yards of pullets that are as much alike as "peas in a pod." They are broad, low and blocky and are double-laced in every section. His cockerels are also a fine lot and he has young birds that are fit to show and win in any show. To look at his flock, one would think that Mr. Aikman did not look after utility points, but only bred for fancy, but he is careful to go after the utility as well as fancy; in fact, he makes it a point to breed his stock to standard size and as for egg production, they are all that could be desired, and we are satisfied that if any one wanting either stock or eggs should buy from him, they will get more than their money's worth.

Another very noticeable feature in this particular strain of fowl, is the fact that they are hardy, having been in his yards a number of times during the winter and the rainy season, we have failed, so far, to find a single case of roup. We are glad to present, to the readers of the Cultivator, cuts of some of Mr. Aikman's international prize winners. These cuts do not do the birds justice, as one has to see the birds before he can appreciate the beautiful color in them. The male birds are a greenish black with rich yellow legs. The females have bright red combs, the ground color and their body being a nut brown with two narrow lacings of greenish black. This gives the bird a very handsome appearance. Their appearance is that of a powerful and strong bird, and being very alert they command the attention and admiration of any lover of fine birds.

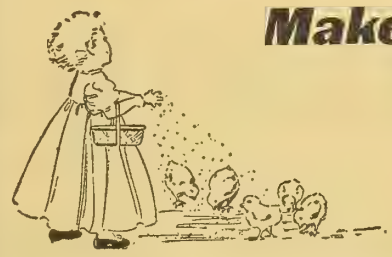
The single hen shown herewith is a winner in England and America's largest shows. She is very short-legged and heavy body. In fact she is a typical specimen of the breed and weighs about eight pounds; is double-laced in every section and is what we consider a true color for the exhibition female.

Mr. Aikman's initial exhibition of this breed was in Los Angeles during the season of 1907 and 1908. He exhibited at both of the Los Angeles shows in the best class of Cornish fowl ever brought together on the coast and won every first and second prize. This fall he exhibited at San Jose, Oakland, Santa Barbara, Pomona and Los Angeles, and won practically every prize that he showed for. At the last Los Angeles show, in what was considered one of the largest and strongest classes of the season, he won every first and second prize, also a silver cup for the best 25 table fowl, competing with all breeds. His show record is unequaled by any breeder of any variety on the coast for the past five years. Mr. Aikman has spared neither money or energy in building up his strain of Cornish Fowl and we believe he has the best in this country, either east or west and his success is due to a careful and painstaking breeder. Any one desiring either stock or eggs of this variety, should write him asking for his illustrated catalogue and price list. During the last show, Mr. Aikman exhibited a fine silver cup which he expects to offer next season for the best exhibit of birds hatched from his eggs or raised from stock which he sells, so any one wanting to get a strain of practical and fancy birds that cannot be surpassed by anything on this continent, can feel sure, in breeding this strain, of getting all that can be desired. His address is 1134 E. First St., Los Angeles, Cal.

Plow up the chicken yard, spread lime on it, and thickly sow with clover seed. The latter may not do so well about the coops, but farther away it will grow sufficiently to make a green covering for the chicks to pick at. Turning the ground destroys the gape worm and guards against other diseases, the germs of which, as well as the eggs of the worms, often find lodging in the surface of the soil where fowls congregate.

Coulson's Special Dry Chick Food

Makes Them Grow



COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

MORSE-SEEDS

Our beautiful 1909 Catalogue of Seeds, Plants and Trees is not only ornamental but very useful.

A few of the things that are especially instructive are the following:

On Page 32 A very complete article on "How to Grow Onions for Market."

On Page 50 A very useful "Classification of Flowers."

On Page 53 A very good article on the making of "Hot Beds."

On Page 81 A thorough and concise "Treatise on the Rose," giving brief but full directions for planting—pruning—varieties—soil and position—watering—diseases—forms.

On Page 106 A statement about Dahlias, which everyone should know.

On Page 113 An article of great merit on pruning and planting fruit trees.

We will mail the Catalog free to anyone sending name and address.

General Agriculture

DISK-HARROWING ALFALFA.

THE disking of alfalfa is a common practice, and seems to be an especially effective in destroying weeds and breaking up the silt blanket deposited in cases where muddy water is used for irrigation. The ordinary disk harrow is widely used for this purpose, but R. H. Forbes, in a bulletin of the Arizona Station, states that a special machine "for the cultivation of alfalfa has been devised on the principle of the disk harrow, but with rows of strong spikes or digging teeth in place of the continuous edges of disks. These machines are stated to be in successful operation in Australia and South Africa, and one form was introduced into Arizona in 1907.

"One man with an 8-foot machine and four horses will get over 8 to 10 acres of alfalfa in a day. This work may be done in winter when teams are more at leisure; but it is probable that in summer also, after cutting and before irrigating, an occasional disking, to break up the sediment blanket, may be well worth while, especially on the upper ends of alfalfa fields."

In South Africa the necessity of disk cultivation is recognized to the extent of having contests in which prizes are given for the machine most closely meeting the requirements.

A. M. Ten Eyck, of the Kansas Station, considers the cultivation of alfalfa desirable, and recommends disking in the early spring. He found "that less injury was done the alfalfa and the best work accomplished by setting the disks rather straight and weighting the harrow so as to make it cut 2 or 3 inches deep;" then cross-disking the field and harrowing it with the common straight-tooth harrow. He states that "the common disk-harrow is more generally used than any other implement to cultivate alfalfa, and when properly adjusted does good work. The spike-tooth disk, known as the 'alfalfa harrow' was used on the alfalfa fields at the experiment station farm during the seasons of 1907 and 1908. This harrow does good work when properly adjusted, and is perhaps a better implement for this purpose than the common disk-harrow."

IN THE MOUNTAINS.

The ends attained by disking alfalfa are thus concisely stated by Professor Forbes:

At a trifling cost, varying according to individual circumstances, the disk-harrow splits and spreads the crowns of alfalfa plants, causing them to develop additional tops; it destroys the egg deposits and larvae of certain injurious insects; it destroys weeds; it breaks up the silt blanket resulting from the use of muddy irrigating water, allowing better penetration of

water and air to the roots of the crop; it loosens up certain dense soils; and to some extent it incorporates beneficial sediments and fallen alfalfa leaves with the soil.

As one of the most serious obstacles to the successful culture of alfalfa, particularly in the Eastern United States, is the crowding out of the plants in the earlier stages of growth by weeds, the introduction of implements and methods which will destroy or control the weeds is of great importance. The use of the disk harrow as described above seems to offer an efficient and practical means of securing this result.

VALUE OF FERTILIZER.

THE CULTIVATOR recently had inquiry as to computing value of commercial fertilizers. We give herewith a table of values accepted by the experiment stations of Massachusetts, Rhode Island, Connecticut, New York, New Jersey and Vermont of prices actually prevailing on the open retail market there in the form of raw unmixed material. Here they may vary somewhat, but the comparison will be valuable. The figures are furnished by the New York Experiment Station.

	Cts. per pound.
Nitrogen in ammonia salts	17½
" in nitrates	18½
Organic nitrogen in dry and fine-ground fish, meat and blood and mixed fertilizers	20½
" in fine-ground bone and tankage	20½
" in coarse bone and tankage	15.0
Phosphoric acid, water-soluble	5.0
" citrate-soluble (reverted)	4½
" in fine-ground fish, bone and tankage	4.0
" in cottonseed meal, castor-pomace and ashes	4.0
" in coarse fish, bone and tankage	3.0
" in mixed fertilizers, insoluble in ammonium citrate or water	2.0
Potash as high-grade sulphate, in forms free from muriates (chlorides), in ashes, etc.,	5.0
Potash in muriate	4¼

Valuation and Cost of Fertilizers.

The total cost (to the farmer) of a ton of commercial fertilizer may be regarded as consisting of the following elements: (1) Retail cash cost, in the market, of unmixed trade materials; (2) cost of mixing; (3) cost of transportation; (4) storage, commissions to agents and dealers, selling on long credit, bad debts, etc. While the total cost of a fertilizer is made up of several different elements, a commercial valuation includes only the first of the elements entering into the total cost, that is, the retail cash cost in the market of unmixed raw materials.

Valuation and Agricultural Value.

The agricultural value of a fertilizer depends upon its crop-producing power. A commercial valuation does not necessarily have any relation to crop-producing value on a given farm. For a particular soil and crop, a fertilizer of comparatively low commercial valuation may have a higher agricultural value; while, for another crop on the same soil or the same crop on another soil, the reverse might be true.

Simple Rule For Calculating Approximate Commercial Valuation.

Multiply the percentage of nitrogen by 4 and add to the product the figures representing the percentage of available phosphoric acid and of potash. The sum expresses in dollars and cents the approximate commercial valuation of the fertilizer. For example, take a sample which will analyze Nit. 2.52 per cent, available Phos. Acid 6.31 per cent, Potash 6.64 per cent.

2.52 (per ct. of nit.) multiplied by 4, equals	$10.08
6.31 (per ct. of available phos. acid) equals	6.31
6.64 (per ct. of potash) equals	6.64
Total, per ton equals	$23.03

If a fertilizer contains only one or two of the three essential fertilizing ingredients, the rule can be applied equally well.

While the results given by this rule are not exact, they are fairly accurate and the rule has the great advantage of simplicity. It does not take the insoluble phosphoric acid into consideration at all.

A somewhat more accurate valuation would be made if the following rule is followed:

Multiply 4.1 by the percentage of nitrogen.

Multiply 0.9 by the percentage of available phosphoric acid.

Multiply 0.4 by the percentage of insoluble phosphoric acid (total minus available).

Multiply 1.0 by the percentage of potash.

The sum of these 4 products will be the commercial valuation per ton on the basis taken.

Illustration.

An analysis which shows a certain fertilizer to have the following composition: Nitrogen 2.52 per ct.; available phosphoric acid 6.31 per ct.; insoluble phosphoric acid .89 per ct.; potash 6.64 per ct. Following this method of valuation, the computation would be,

Nitrogen	4.1 x 2.52	$10.31
Available phosphoric acid	0.9 x 6.31	5.68
Insoluble phosphoric acid	0.4 x .89	.35
Potash	1.0 x 6.64	6.64
		$22.98

This latter rule assumes all the nitrogen to be organic and all the potash to be in the form of the sulphate. If a considerable portion of the nitrogen exists in the fertilizer as the nitrate of soda or as sulphate of ammonia, and the potash is present as the muriate, the valuation should be somewhat less.

Farmers should be warned against judging fertilizers by their valuations. A fertilizer, the cost of which comes chiefly from the phosphoric acid present, would value much lower commercially than a fertilizer with a high percentage of nitrogen, and yet the former might be the more profitable one for a given farmer to purchase.

ANTHRAX IN MAN.

Anthrax may be transmitted to man in handling the carcasses and hides of animals which have succumbed to the disease. The infection usually takes place through some abrasion or slight wound of the skin into which the anthrax spores, or bacilli, find their way. The point of inoculation appears at first as a dark point or patch, compared by some writers to the sting of a flea. After a few hours this is changed into a reddened pimple, which bears on its summit, usually around a hair, a yellowish blister, or vesicle, which later on becomes red or bluish in color. The burning sensation in this stage is very great. Later on this pimple enlarges, its center becomes dry, gangrenous, and is surrounded by an elevated discolored swelling. The center becomes drier and more leather-like and sinks in as the whole increases in size. The skin around this swelling or carbuncle is stained yellow or bluish and is not infrequently swollen and doughy to the touch. The carbuncle itself rarely grows larger than a pea or a small nut and is but slightly painful.

Anthrax swellings, or edemas, already described as occurring in cattle, may also be found in man, and they are at times so extensive as to produce distortion in the appearance of the part of the body on which they are located. The color of the skin over these swellings varies according to the situation and thickness of the skin and the stage of the disease, and may be white, red, bluish or blackish.

As these carbuncles and swellings may lead, sooner or later, to an infection of the entire body, and thus be fatal, surgical assistance should at once be called if there is well-grounded suspicion that any swellings resembling those above have been due to inoculation with anthrax virus. Inasmuch as physicians differ as to treatment of such accidents in man, it would be out of place to make any suggestions in this connection.

To show that the transmission of anthrax to man is not so very uncommon, we take the following figures from the report of the German government for 1890: One hundred and eleven cases were brought to the notice of the authorities, of which eleven terminated fatally. The largest number of inoculations were due to the slaughtering, opening and skinning of animals infected with anthrax. Hence the butchers suffered most extensively. Of the 111 thus affected, thirty-six belonged to this craft.

In addition to anthrax of the skin (known as malignant pustule), human beings are subject, though very rarely, to the disease of the lungs and of the digestive organs. In the former case the spores are inhaled by workmen in establishments in which wool, hides, and rags are worked over, and it is therefore known as wool-sorter's disease. These forms of the disease are more fatal than those in which the disease starts from the skin.—The Veterinarian.

GARDEN ALMANAC.

An excellent publication for the reading table is the Garden & Farm Almanac for 1909, not only an almanac but a reference book for the home farm and garden. Its planting tables may not be absolutely fitted to the general run of California's conditions but many other points are so valuable that it is well worth the two-bit price which is placed upon it by the Doubleday, Page & Company of New York, who are its publishers.

FARMERS' BOOKS

Order Through the Cultivator

THE BOOK OF ALFALFA.—By F. D. Coburn. Most thorough treatment of this most important subject by its leading authority. The book is printed on fine paper and illustrated with many full page photographs that were taken with the especial view of their relation to the text. 336 pages, bound in cloth, with gold stamping.
Price..... $2.00

FEEDS AND FEEDING.—By Prof. W. A. Henry. Is a thorough, accurate and reliable handbook for students and stockman, giving most practical and useful knowledge on plant growth and animal nutrition, feeding stuffs, feeding animals and every detail pertaining to this important subject, indispensable to every owner of live stock. 658 pages. 6x9 inches.
Cloth $2.00

AMERICAN GRAPE GROWING AND WINE MAKING.—By George Husmann, of California. With contributions from well known grape growers, giving wide range of experience. The author of this book is a recognized authority on the subject. Illustrated. 269 pages. 5x7 inches.
Cloth $1.50

STANDARD OF PERFECTION.—By the American Poultry Association and used as the standard for judging all shows. The thing for dealers in fancy stock.
Cloth $1.50

PERFECTED POULTRY OF AMERICA.—This is the most recent publication, and is one of the finest poultry books ever issued. It contains full page illustrations of all breeds and varieties of poultry, turkeys and water-fowl. On many of its pages are represented the feathers from each section of the fowl. Gives the information necessary for the selecting of the best specimen in your flock.
Cloth $2.50

A. B. C. AND X. Y. Z. OF BEE CULTURE.—By A. J. and E. R. Root, the leading authority on Bee Culture Its reputation is known to all Beekeepers. 536 pages.
Cloth $1.50

CAMPBELL'S SOIL CULTURE MANUAL.—By H. W. Campbell. The originator of the "Campbell System of Dry Farming." A complete guide to scientific agriculture as adapted to the semi-arid regions. Of great value to all Western ranches. 320 pages.
..... $2.50

THE NEW AGRICULTURE.—By F. Byard Collins. A new and authoritative work dealing with the changing agricultural conditions. Why "Back to the Soil" is calling millions from the cities to the farm. The debt which agriculture owes to science. Irrigation, fertilization, machinery, etc.
Illustrated, 374 pages, cloth.....$2.00

Crimson Winter Rhubarb a Wealth Maker for California

A Small but Important Plant Which Is Prophesied to Bring Forth Much Money from the Soil of California. Not Content With What the Soil Has Done, J. B. Wagner, of Pasadena, Continues His Breeding Experiments to Bring Forth a More Perfect Plant. Extensive Plantings Will Be Made This Season.

THE question most generally asked regarding the planting of Crimson Winter Rhubarb has been, "But will we be able to dispose of it at a fair price?" This question is now being answered and very satisfactorily by the Phalanx Company of Los Angeles. This concern is a distributor of California fruits, but was organized primarily to supply the east with this product for which there is such keen demand in that market. Some cars have already been shipped to Eastern markets, principally Philadelphia, and the reception which it has received there justifies the company in holding out inducements to planters in this state to plant this luscious product. One member of this company, about whose ranch devoted to the culture of rhubarb at Pomona this paper has had former articles, is Mr. D. D. Bryant, though his principal concern is in the growing of rhubarb. The President of the company is Mr. Comly Shoemaker, while Mr. Harry A. Jamison is secretary and treasurer. The office in Los Angeles is at Room 513 Chamber of Commerce building, and the Eastern distributing office is at 2nd and Dock, Philadelphia. The shipments so far made by this concern this year are developing more and more the proof that Crimson Winter Rhubarb can be laid down in Eastern markets at great profits to producers.

J. B. Wagner.

These promising developments call attention again to a character whom this paper has often referred to as a man who is proving of great benefit to this state in insistently bringing forth to public attention the famous Crimson Winter Rhubarb with which he has worked in such a tireless way to produce a better plant by selection and hybridizing. This man is Mr. J. B. Wagner, the rhubarb king of California.

Small Beginnings.

From a beginning of a hundred plants bought of Luther Burbank seven years ago, for which the sum of $35 was paid, Mr. Wagner has produced millions of plants and forwarded to all sections of the world. This $35, Mr. Wagner admits, looked exceedingly big to him at that time. But the energy and ability which he has thrown into his campaign for a better and more productive plant have succeeded in producing such satisfactory results that the demand for them has constantly increased and today Mr. Wagner is on vastly different ground than he was seven years ago. This rhubarb which is the Crimson Winter variety first brought out by Mr Burbank, and more recently vastly improved by Mr. Wagner has won in all sections where it has been planted under right conditions. In general, we may say that one principal condition required is shown by the answer to the question, "Will the orange trees thrive and do well here?" Wherever that tree does well the rhubarb has been found to do its best and to produce its crop at a time when it commands the best price in the East.

J. B. WAGNER STANDING BY A HILL OF HIS FAMOUS CRIMSON WINTER RHUBARB.

Seeking Something Better.

The simple reproduction of a large quantity of this remarkable "fruit" was not sufficient to satisfy the ambition of Mr. Wagner, but, good as was the original product, he demanded in some particulars a greater degree of perfection.

One fault which has been found with Crimson Winter has been the smallness and shortness of the stalks of the original plants. To overcome this, Mr. Wagner has introduced from all sections of the world, by the aid of the Department of Agriculture, a large number of seedlings which he used in hybridizing or crossing with the Crimson Winter, hoping to secure equally as fine a quality as is produced by the small stalks of the Crimson Winter and at the same time the larger size of some of the so-called Giant variety. It is easy enough to secure by this hybridizing the larger size and this has often been done; more lately Mr. Wagner has succeeded in combining the quality and size together with the ever-bearing disposition. In this way, and by selection of seed from the finest plants remarkable results have been secured.

Not Large but Important in Results.

In the experimental garden which Mr. Wagner uses in his work, he has 14 acres. Not so large as some of the ranches of this state but large in its influence and especially in the betterment of this product which is now bringing many dollars to the Coast and the sending of many carloads and eventually train loads across the continent. A part of the 14 acres which Mr. Wagner owns in the outskirts of the city of Pasadena is given over to his cosy and comfortable home, where with his wife and two daughters and son, he lives his unostentatious life in the enjoyment of music and art, and studies the problems which confront him. The growing of the rhubarb for commercial purposes is but a small factor in this man's work. His main effort and endeavor is to center on reproducing more perfect plants which will benefit the actual producer.

Big Profits.

Besides the large plantation of Mr. Bryant at Pomona, which is spoken of at the beginning of this article and which now amounts to considerably more than 100 acres, there are many others in Southern California which are coming into bearing. We may refer to that of Mr. Loftus at Monrovia, who has become an enthusiastic planter. Mr. Wagner now has growing over a quarter of a million plants and expecting to have at least 100 acres to market next winter his gardens will add materially to supplying the eastern market. One reason why these gardens have increased so materially is the fact that they have proved so exceedingly profitable. Mr. Wagner asserts that every one which is given intelligent attention at all will give an income of $600 to $800 the first year after planting. It is predicted that the car load shipments which are now being made will soon extend so that train-load shipments will become a common sight through the main shipping points of California.

Information Demanded.

Other articles will appear during the coming season regarding Mr. Wagner and his work, and in them will be given more particular information regarding details of planting and of care. This is because the requirements of this plant as to soil and the limited amount of water are such that its more extended planting should be encouraged. But meantime, any one wishing for instruction as to location and care and how the plants may be procured would best write to Mr. J. B. Wagner, the Rhubarb King, of Pasadena, California.

Regarding its care Mr. Wagner says: Rhubarb is as easily and cheaply gathered as apricots or peaches; hence at same rate per ton is a much better paying proposition, even the first year than any deciduous orchard in its prime. It delights in any good vegetable soil that produces good crops of onions, sweet potatoes, melons, etc. Excessive heat seems to have no ill effect on it once it is established, if properly cared for.

Plants should be set same depth as they originally grew, watered immediately, followed in a couple of days with another irrigation, then keep soil in well-tilled and moist condition. Irrigate as often as is necessary to keep from drying out.

A liberal use of well-rotted manure, thoroughly mixed with the soil is greatly beneficial and sure to repay many fold for trouble and money invested. Repeat application every two years. Barn-yard manure or blood fertilizer or ammonia preferred.

Rambler

Model Forty-One was built to travel over all kinds of roads—to perform handy service for the man with work to do.

Its special advantages are—powerful double opposed two-cylinder engine, enclosed transmission for protection against mud and dirt, detachable tonneau, big wheels and tires, easy to operate, easy to care for, small cost of up-keep.

We have the statements of many farmers who own Ramblers to prove these things.

A new and instructive farm folder will be sent free to anyone for the asking. It's full of testimonials from owners who tell why the Rambler is the best car for the farmer.

QUERIES.

(Continued from Page 151.)

ture growth of the young stock, and further the experiments made showing practically no difference in the thrift of the two trees, we think the general custom now is to remove the entire top except about six inches of the young tree above the bud. This removal is made as soon as it is assured the young bud has taken in the springtime, even if it has not started to grow. Then later when the bud has grown high enough to be tied to a stake and the young bud is thrifty, the entire stump is removed with a slanting cut just above the bud.

Seed for Orange Stock.

When is the proper time for planting orange seed? From what variety of oranges are they secured? Is grape fruit stock satisfactory to bud Valencias on?—J. G. R., Fullerton.

Plant seed in April or May. The ordinary seedling orange is used more generally though many planters secure the sour orange seed from the Florida wild trees. These can be had of the seedmen. Grape-fruit stock is all right for Valencias and even preferred by some because of its giving strong, thrifty trees.

Cannibals.

What is the cause of recently hatched chicks eating each other, especially picking each other's feet till they are all raw? What is cause and how can I prevent the trouble?—G. C., Lakeview.

This question was fully answered by Mrs. Metcalf in issue of January 28, page 103. It is a case of lack of some element in the food, presumably meat and bone, which the youngsters require. But the habit once started is very hard to break up, even if the food is corrected. Hereafter, prevent the starting of the habit by properly balanced ration.

Asparagus Culture.

Please give method of field culture of asparagus.—Subscriber, Lompoc.

Plant in rows 4 feet apart, 18 inches to 2 feet apart in the row. The furrows should be 6 to 8 inches deep and the plants covered with but an inch or two of soil at first. Gradually fill up with soil and old manure if you can get it. Give clear culture the first season. Where the winters are severe, it is the custom with the best growers to cover the entire surface with a heavy coat of manure and allow it to lie until spring. Unless you live near a large city it is difficult to get manure and still more difficult to handle the land during our winter—although it can be done. Asparagus is a gross feeder and it is useless to attempt to grow a paying crop on ordinary land without heavy fertilizing.

Unless you have an exceptionally rich piece of land, be sure of results before you risk as much as one acre. An acre set in rows four feet apart and plants two feet in the row will require about 5500 plants. Most dealers advise to set two year plants and I never could understand why unless it was because they become wholly unsalable after two years. I should always prefer strong selected one year plants. Do not attempt to cut any asparagus the first year after setting out as the object is to get a well established root system before you begin to cut, and this demands that the plant be allowed to make abundant foliage. Cut sparingly—that is, not too late in the season—the second year. After that the bed can be cropped to its full capacity. A visit to the delta lands of the San Joaquin or Sacramento rivers where so much asparagus is grown would well repay any one who thinks of embarking in the work to the extent of even one acre.

If you wish to grow your own plants, an ounce of seed will give you about 200 good plants. Sow in rows about 15 inches apart in good mellow soil, about the last week in February. Thin the plants so that they stand two or three inches apart, give thorough care through the season. Sow at least one-fourth more than you think necessary for your needs so that when you come to plant your permanent field you can reject all weak and inferior plants.—Q. A. L.

Half Breeds.

I have some well bred Barred Rocks which do not lay very good, though they are well fed and run at large. They seem to be very fat and heavy. Do you think if I were to cross them with a Brown Leghorn rooster, would it help the laying qualities? I don't think well bred Barred Rocks are good layers, though I like them.—A subscriber.

Well bred Barred Rocks are sometimes the best of layers, although very apt to take on too much fat and become lazy about it, if given all they will eat. If a cross is made with a good laying strain of Brown Leghorn or any other lively breed, the pullets should make excellent layers, but the question would be how to mate them the following year to keep these good qualities. I have known Eastern farmers to keep up the laying qualities of their flocks by introducing a new male every year, of an entirely different breed. Of course their flocks were as varied as Jacob's coat, but so long as the egg yield kept up, they cared very little for that.

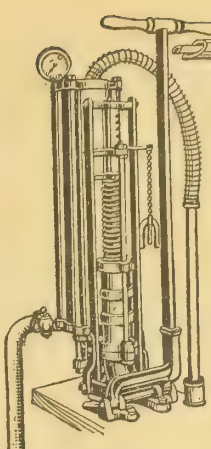
The R. I. Red people claim that by this very out-crossing, they have built up the good laying qualities of their breed, although they no longer practice it. Personally, I would prefer a male of either R. I. Red or Buckeye to mate with the Rocks, as the out-cross would give a better market fowl, and quite as good layers, while the sitting habit would not be lost.—Mrs. Frank Metcalf.

Hotbeds.

I would like to get information about hotbeds. At the present time I am unable to get any dry horse manure; everywhere it got too wet. If I take wet horse manure, spread it out to dry, could I, after it gets dry, add ammonia and bring manure to heating through this? If this can be done, what are the proportions and does it require a certain liquid?—L. D., Anaheim.

It does not matter if the horse manure got wet, provided it is fresh and put together on a heap. It will heat and that very violently if there is considerable quantity of it. If you could get some that is fresh from the stables to mix with that that got wet it would greatly aid in heating. I never tried the method suggested and would think it very much cheaper to get some fresh manure. I have in preparation an article on hotbeds that will appear soon in the Cultivator.—Q. A. L.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.



This is the Pump

that can be operated continuously at high pressure without the muscle-racking, exhausting, "man killing" exertion required for ordinary pumps. High pressure spraying means more and better fruit—and consequently more money for the grower.

Bean Magic Spray Pumps

are different from other pumps. They run smoothly and easily without clogging, and one man keeps up high pressure for two lines of hose. And they **save one-third the labor.** The Bean patent spring does it. The operator does half the work at each stroke of the handle, and works against but half the pressure indicated on the gauge. A trial quickly removes all doubt.

Our illustrated catalog No. 21 describes ten sizes of handpumps, and contains much valuable spray information, and formulas. Catalog No. 18 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

1-2 Million Eucalyptus Trees

In Variety

Transplanted in flats of 100 each. We prefer orders of 1000 rather than 10,000; outside limit 20,000. Our trees are of the highest standard in quality. Correspondence invited. Our Booklet telling when, how, and what to plant free to our patrons only. Address

W. A. T. STRATTON, Nurseryman, Petaluma, Cal.

When writing advertisers, mention Cultivator.

Government Land.

Will you inform me if there is any government land to be had in Imperial county? Also when is the government land under the Laguna Dam near Yuma to be thrown open?—Subscriber, Healdsburg.

The more desirable land has been taken up in Imperial valley, but there is yet much on the outskirts open to entry. We have been told of excellent land which is about 20 miles from Imperial, but have not been informed as to the possibility of getting water on the land. We cannot inform you when the Yuma land will be thrown open to entry.

Tiling to Remove Alkali.

Kindly tell me how deep and how far apart tiles should be placed for removing alkali?—F. C. Toyoshima, Santa Ana.

Thirty feet apart and three feet deep is probably a fair average of the requirements and the tiles should have all the fall possible in order to secure perfect drainage. By digging the ditches deeper and placing the tile down farther the ditches may be farther separated, but about the above figures is usually preferred.

Guinea Fowls.

A subscriber of the Cultivator is desirous of getting in touch with some one who can supply him with Guinea fowls—a cock and five hens. Also as to whether they will stand the climate of Imperial valley. Can any subscriber give information along these lines?

Lemon Seedlings.

I wish you would give through your columns directions for growing lemon seedlings, how to select the fruit for the seed, how ripe the fruit should be and other information about raising it. Also how are they budded?—Subscriber, La Mesa.

If your aim is to grow lemon trees, they are not budded upon lemon roots. The lemon root is too susceptible to gum disease to be tolerated. The sweet seedling; or in case of heavier soils, the sour seedling orange, is to be preferred. The latter especially is more free from the gum disease. This seed may be secured from seedmen who get it from Florida. If you prefer to grow from the sweet seedling seeds, then get large plump seed from the best seedling oranges you can find. These are planted in seed bed where they are grown for one year. Next year they are planted in nursery row where they remain for another year or possibly attain sufficient size by the following fall to bud to the lemon. The lemon bud is one of the easiest of all buds to make live and even a novice may succeed with it if he gives it reasonable care. More particulars regarding raising from the seed will be given in the Cultivator of February 25, which will give more attention to citrus fruits.

Alkali.

Will you kindly tell me if 2½ per cent alkali on the soil is detrimental to crop production and will the Agricultural Experiment Station analyze soil free?—A. R. S., Beaumont.

We know of no crop which will stand the amount of alkali which you mention. Prof. Hilgard says in "Soils:" "For the sandy loam of Tulare substation for instance, the maximum for cereals may be approximately stated to be one-tenth of one per cent for sal soda, a fourth of one per cent for common salt and from 45 to 50 one-hundredths of one per cent Glaubers salts. For clay soil the tolerance is in general markedly less, especially as regards sal soda, s in their case the injurious effect the tilling qualities of the soil is superadded to the corrosive action o that salt on the plant."

The highest amount of alkali which alfalfa will stand, which is one of the most resistant of any of our plants, after it is established, is 102,480 pounds of alkali in four feet depth of your soil. Young plants of alfa will find difficulty in resisting or tenth of that amount, so that eve after being established, your soil would have difficulty in maintaning the life of alfalfa.

You do not mention the kind of alkali you have, black or white. If of black variety, it is much more corrosive than the white or the Glaubers salts. You may have soil analyzed without charge by the chemical department at the State University. Before taking your sample of soil, however, would write to the University at Berkeley and ask for a blank which will give instructions how to select a sample.

Fig Cuttings.

Please tell me the proper time for planting fig cuttings. Is it best to use new sucker growth or the older tree wood?—H. E. S., Nordhoff.

Fig cuttings should be planted at once. The writer has seen excellent trees grown from suckers which root much quicker than the top growth. Often the sucker which comes out below the ground will have rootlets started and such a cutting under favorable conditions may give you fruit even the first year.

Chickens Dying.

I recently fed my 80 hens which were healthy and clean, for their evening meal a pail of soft feed in which was mixed a quart of peas that had spoiled. They smelled very badly. Next morning 16 were dead, all others dazed, with necks stretched out very long, head hanging down. In a few days all were dead. What was the cause?—H., Lodi.

Plainly the hens died from poisoning. It is often possible to purchase beans or peas which were exposed to rain but afterward carefully dried, and while blackened and unsightly for human food are still in good condition as to content of protein which is needed by the laying hen. But to feed any decaying vegetable matter or even that which is soured is almost sure to prove disastrous. The human stomach will not stand it, neither will that of stock. Formerly the swill barrel was the cause of much disease with swine. Swine faisers now realize that sweet, wholesome food is just as advantageous in feeding their hogs as in feeding their children. The economy which demands the saving of spoiled food, if carried too far, defeats its own ends. Many thousands of little chicks have died because of feeding a mash which has been allowed to stand until it has soured. Feed only sweet wholesome food.

Gypsum.

Please tell me the price of gypsum and where it can be secured.—W. A. G., Inglewood.

The price of gypsum f. o. b. Palmdale in car load lots is, we believe, $4.50. In smaller quantities, f. o. b. Los Angeles, in sacks, $8.00. It may be had by addressing the Acme Plaster Co., 750 Alameda Street, Los Angeles.

Leaky Flume.

Replying to A. L. P.'s inquiry for

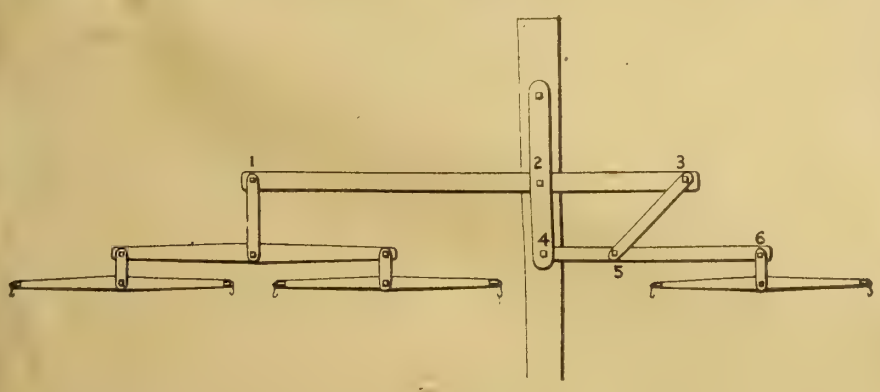
...best paint for a flume; the best ...to repair an old flume, or a new ...ue, is to line it with one of the new ...atent roofing fabrics. Select one ...ith a canvas, or burlap center or ...oundation, as those made of Manilla fiber are liable to sag and tear away from the nails, where exposed to the hot summer sun on a vertical wall. ...ine the flume carefully, cementing ...joints and nail holes according to ...ections furnished with each roll of ...ofing. Give the lining a coat of the same cement every other year, and it is practically everlasting. It will not rust, expand with heat, or contract with cold, and the flume will not leak a drop. It comes in rolls of 100 square feet, and here costs from $2.50 to $4.00 per roll according to the thickness.—W. H. S., Selma.

An excellent suggestion, and we appreciate the courtesy of W. H. S. in sending it in.

Transplanting Orange Trees—Three Horse Evener.

Can orange trees, Valencias, be reset at the age of five or six years with any degree of success? Is it advisable to prune lemon trees severely that are eight years old, bearing well, and have never been pruned? What is the best three horse evener for a farm wagon?—H. C., Santa Ana.

Orange trees at five or six years old can be moved as a matter of possibility but not with any degree of economy. The original navel trees at Riverside were moved a few years ago after being in the ground more than 20 years. They were, however, given great care and great expense was incurred in the moving. Of course they were important trees and one of them was replanted by President Roosevelt while in this state. As a commercial proposition the trees may be better made into stove wood and new, young trees bought from the nursery. No, do not prune the lemon trees severely at first. Cut back gradually and thin out dead or other wood which is not bearing in the center of the tree. Force it to continue and make new wood which will continue its regularity of bearing. Regarding the three horse evener, we give herewith engraving and notes which will explain. This is from sketch and figures given us by Mr. Perry Lewis of Tustin and printed first in the Cultivator of August 1, 1907:



Two feet from 1 to 2; one foot from 2 to 3; one and one-half feet from 4 to 6; six inches from 4 to 5; six inches will do from 2 to 4. Get your pieces straight and measure distance from 3 to 5. Have square holes cut in irons for bolts, so they can be easily removed. In this cut the nigh horse walks next to tree; should you wish to drive the off horse next to the tree, you can reverse the plan. You must place the double-tree part back six inches from the place where you would hitch two horses, or shorten traces. I am using one on a disk and do not notice much side draft.

Sunflower Seed.

Is the sunflower seed a good crop and would one find ready sale for a large quantity of seed?—Subscriber, Lathrop.

We do not know how profitable it would be but there is no question but that a market can be found for these seeds. In fact the Aggeler & Musser Seed Company of Los Angeles say they will purchase quantities of it at Eastern prices plus freight across the continent. The state does not produce what is used here and it nearly all has to be imported. No assurance can be given but probably the price would be not far from $2.75 per hundred. The growing of such crops, however, should always be preceded by correspondence or an understanding with buyers of such seeds before extensive planting is made.

China Trees.

I have some small China trees which I contemplate budding over to umbrellas. A friend contends the resulting buds would still be Chinas.—W. R., San Bernardino.

If the bud takes and starts to grow you may rest assured it will be true to the tree from which it was cut. We have never before heard such a claim disputed and if you can make your buds take and grow you will find them true umbrella trees.

Sweet Pea Seed.

Can you inform me as to how many pounds of sweet pea seed can be raised to the acre? And as to how hot a climate they will stand. Also soil best suited to them.—Subscriber, Santa Barbara.

Any good garden soil and climatic condition will answer for the growing of sweet peas. They are not very fastidious. The average production is probably about half a ton of seed per acre which may command in the neighborhood of seven cents in the market. This would give a return of about $70 per acre. Such a product, however, should not be grown without previously contracting for the disposal of the seed as it is very probable disappointment would be the result. One large Los Angeles seedman has already contracted for several hundred acres which are now growing in the neighborhood of Los Angeles. It is of course too late to plant seed for this year as November or December are proper times for planting.

Lentils.

Where are lentils raised? Will they grow here? I suppose they may be raised for home use. Will the surplus be of value for feeding?—New Subscriber, Santa Cruz.

The requirements for growing this crop are not very much different from those of the ordinary pea. They succeed best in a dry, sandy soil. The seed is very valuable for pigeons and we doubt not poultry would do well on it. They would doubtless grow in your section. While the market is

FARM LANDS FOR SALE.

IMPERIAL VALLEY—DO YOU WANT to help us pioneer the **Weston Townsite** and get paid for it by getting in on the ground floor on the first 10 acre tracts, "without money and without price?"

We can offer a few 10 acre lots surrounding the Townsite at $1000.00 each, to be paid for in work on adjacent tracts or on a share basis of planting to oranges or grape fruit or to vines and deciduous trees. WESTON is situated in the centre of the famous No. 8 Water District and has more than 50,000 acres of the finest garden soil in the Valley tributary to it.

Remember the history of the townsites of Brawley, Imperial, El Centro, Holtville and Calexico and profit while you may.

If you are free to go there we can help you and you can help us. For particulars apply to IMPERIAL INVESTMENT CO., 315 H. W. Hellman Bldg., Los Angeles, Cal.

DO YOU WANT 160 ACRES OF GOOD government land? Rich soil, no alkali or hard pan. Healthy, no malaria. Near oil wells, prosperous, plenty work for settlers. Eight miles of good R. R. town. Have six months to come back on land. No hardships. May be away nearly six months at a time. First cost $160 for 160 acres includes your traveling expenses. Mr. Taft will sign your U. S. title inside of two years. Then you can sell and buy elsewhere if desired. I honestly believe I can help you make Ten Dollars for every dollar you pay me. If you are willing to pay for this information and services come to Cottage Hotel, Armona, Cal. Write JOE CLARK RANCHER, Route 2, Hanford, Cal.

FOR SALE—160 ACRES OF RICH virgin sandy loam land, 9 miles S. W. of Mendota, Fresno Co. Cleared and leveled. Unlimited pumping water. Land $20; with water $30. Free from alkali, hardpan and washes. This is your chance to get land with water worth $150 for one-fifth that price. J. E. FARNHAM, owner, Hollywood, Cal.

FOR SALE—PALOMITAS VINEYARD 194 acres; 106 planted to choice Emperor Malaga and Muscat vines, 3 to 5 years old. Part or all. Half cash, balance on easy terms. MRS. M. E. SHERMAN, Fresno, Cal.

I make a specialty of orange and alfalfa ranches and exchanges. 826 MAIN St., ROOM 9, Riverside, Cal. N. R. BELL.

FOR SALE—LAND WORTH $150 PER acre with water at $40 while it lasts. Rich virgin sandy loam soil free from alkali, hardpan and washes. Leveled and cleared for irrigation. 11 miles south of Mendota in Fresno Co. This is your chance; write J. E. FARNHAM, owner, Hollywood, Cal.

FOR SALE—ON EASY TERMS, A highly improved, very productive, well watered and well situated 40 acre ranch. B. F. YOUNG, Huntington Beach, Cal.

limited to a certain extent it is probable that any surplus you might have could be marketed at a greater profit than to use for stock food. The tops fed green or dry are an excellent forage.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge.

The reason the answers to these queries have been delayed is because the editor of this department has been in Sacramento for two weeks in the interest of legislation to improve the standard of veterinarians in California. Several bills introduced by State Veterinarian Keane for the eradication of scab in sheep, Texas fever tick in cattle, and glanders in horses, as well as other sanitary measures of great interest to stock owners have passed or are well up on the file toward third reading. This state will soon be a clean state and out of Federal quarantine.

Swelling on Horse.

I have a mare that bruised her breast just below the shoulder. There was a slight cut, which I think was made by the head of a nail. The place itself never got sore, but swelling came between her front legs, which made her very stiff. As I kept treating it one way or another, the swelling left between her front legs and traveled back under her belly and the stiffness also disappeared. Now the swelling is in a U shape under her belly, about a foot across the front side. She is fat and appears to be feeling well. No abscess seems to be forming, as I expected. This happened about five weeks ago. There seems no noticeable change since its last location.—S. H., Corning.

Make a thorough examination to see if there is any pus; if so let it out by a large incision. If no pus, have a rowel or seton put through it from top to bottom, clean and move once daily. Leave it in for about two weeks.

Diseased Ovaries.

Please give cause and cure for a mare with following symptoms: Age nine years. In heat continually; urine light and clear; picks up in flesh when idle but gets poor when worked; does not sweat freely but instead pants and trembles, her shoulders, especially, cannot stand anything; legs stock badly; hair dead looking; was all right last summer only in heat; wind was good when I stopped working her in fall. Was fed alfalfa and ran out when idle. In fall, when I began plowing, I changed to barley hay and barley. She got thin and I changed to Indian corn and two quarts bran with occasional feed of alfalfa. Have given her two teaspoonfuls a day of sulphate of iron and gentian root for three weeks. Has had a condition powder two or three times a week all summer.—B. C.

The mare has without doubt got diseased ovaries and these should be removed. She may have a diseased liver but the symptoms caused by the ovaries will often be so varied as to overshadow any other trouble. Have only a first-class veterinarian attempt the removal of the ovaries, as, while it is simple, great care must be exercised.

Sweeny.

What treatment is best for a horse that is sweenyed?—J. D., Los Angeles.

The treatment we have found best is the hypodermic injection of a very strong salt solution, thoroughly sterilized, and injected to the bone. Repeat as soon as the swelling goes away.

To Correct Looseness.

I have a five-year-old mare that has been quite loose in the bowels for about two weeks. She passes considerable brown colored water with dung. Am feeding tame oat hay with no grain; also fed some wild oat hay with the same result. Can you give me remedy?—G. W. H., Reedley.

Get the following: powdered chalk, two pounds; gallic acid, one ounce; mix thoroughly and give tablespoonful twice daily.

Sore Ear.

I have a five-year-old mare. About the middle of last November she got a sore on the inside of the left ear, which broke, considerable pus or fluid coming from the sore. It appeared at times to get better and then worse. The end of the ear bent and hangs down, which looks very bad.—T. G. S., Yettem.

Open the wound so as to give complete drainage, clean it out well and

WHY SHOULD THE SPIRIT OF MORTAL BE PROUD.

The following, written by William Knox, was President Lincoln's favorite poem:

Oh! Why should the spirit of mortal be proud?
Like a swift-fleeting meteor, a fast-flying cloud,
A flash of the lightning, a break of the wave,
Man passes from life to his rest in the grave.

The leaves of the oak and the willow shall fade,
Be scattered around, and together be laid;
And the young and the old, and the low and the high,
Shall moulder to dust, and together shall lie.

The infant a mother attended and loved,
The mother that infant's affection who proved,
The husband that mother and infant who blessed,
Each, all, are away to their dwellings of rest.

The maid on whose cheek, on whose brow, in whose eye,
Shone beauty and pleasure—her triumphs are by;
And the memory of those who loved her or praised,
Are alike from the minds of the living erased.

The hand of the king, that the sceptre hath borne,
The brow of the priest, that the mitre hath worn,
The eye of the sage and the heart of the brave,
Are hidden and lost in the depth of the grave.

The peasant, whose lot was to sow and to reap,
The herdsman, who climbed with the goats up the steep,
The beggar who wandered in search of his bread,
Have faded away like the grass that we tread.

The saint who enjoyed the communion of heaven,
The sinner who dared to remain unforgiven,
The wise and the foolish, the guilty and just,
Have quietly mingled their bones in the dust.

So the multitude goes, like the flower or the weed,
That withers away to let others succeed;
So the multitude comes, even those we behold,
To repeat every tale that has often been told.

For we are the same that our fathers have been,
We see the same sights our fathers have seen;
We drink the same stream and view the same sun,
And run the same course our fathers have run.

The thoughts we are thinking, our fathers would think,
From the death we are shrinking our fathers would shrink;
To the life we are clinging they also would cling—
But it speeds for us all, like a bird on the wing.

They loved, but the story we cannot unfold;
They scorned, but the heart of the haughty is cold;
They grieved, but no wail from their slumbers will come;
They joyed, but the tongue of their gladness is dumb.

They died. Ay! they died; and we things that are now—
Who walk on the turf that lies over their brow,
Who make in their dwellings a transient abode—
Meet the things that they met on their pilgrimage road.

Yea! hope and despondency, pleasure and pain,
We mingle together in sunshine and rain;
And the smile and the tear, the song and the dirge,
Still follow each, like surge upon surge.

'Tis the wink of an eye, 'tis the draught of a breath,
From the blossom of health to the paleness of death.
From the gilded saloon to the bier and the shroud;
Oh, why should the spirit of mortal be proud?

LINCOLN'S GETTYSBURG ADDRESS.

FOURSCORE and seven years ago our fathers brought forth upon this continent a new nation, conceived in liberty, and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation, or any other nation, so conceived and so dedicated, can long endure. We are met on a great battle-field of that war. We are met to dedicate a portion of it as the final resting-place of those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But in a larger sense we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, living and dead, who struggled here, have consecrated it far above our power to add or detract. The world will little note, nor long remember, what we say here, but it can never forget what they did here.

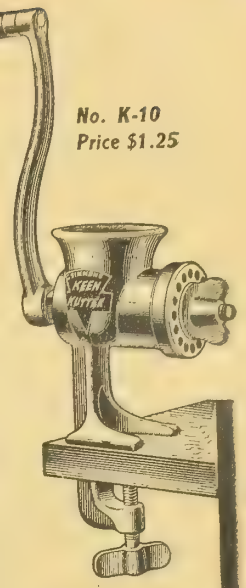
It is for us, the living, rather to be dedicated here to the unfinished work they have thus far so nobly carried on. It is rather for us to be here dedicated to the great task remaining before us, that from these honored dead we take increased devotion to the cause for which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain, that the nation shall, under God, have a new birth of freedom, and that the government of the people, by the people, and for the people, shall not perish from the earth.

ABOUT THE HAIR.

FOR a girl to preserve a lovely head of hair with which nature has endowed her, she must keep the scalp healthy and the hair follicles must be well nourished. Dandruff is a result of a clogged condition of the scalp, being the scaling off of the dead particles of the skin, and in its early stages dandruff may be very easily removed, but if neglected, a diseased condition of the scalp will take place. Equal parts of alcohol and castor oil, applied after a thorough shampoo with soap and water, is the best remedy for dandruff. Hard rubbing is the most effective means of promoting the growth of the hair, and a few minutes vigorous rubbing with the fingers on the scalp daily will soon bear evidence of its efficacy. The scalp must be kept clean, and when hair is naturally oily frequent washing is the only remedy and the best way to clean the scalp and hair is to stir enough good white soap in soft warm water to make a

Less Work—Dainty Dishes

No. K-10
Price $1.25



No woman realizes how much work she could save, and the tempting variety of dishes she could offer at the table, until she possesses a Keen Kutter Food Chopper.

Just a few turns of the handle instead of the tiresome chop, chop at the chopping bowl. Meat, fish, vegetables, fruits are chopped uniformly, coarse or fine as you wish. The

KEEN KUTTER

Meat and Food Chopper

is attached to the table or detached in a second—works so easily a child would enjoy using it—wears a lifetime—more easily cleaned than a chopping bowl.

Sold under the famous Keen Kutter name and trademark, which always and everywhere guarantee satisfaction or money returned. Ask for the Keen Kutter Food Chopper by name.

If not at your dealer's, write us.

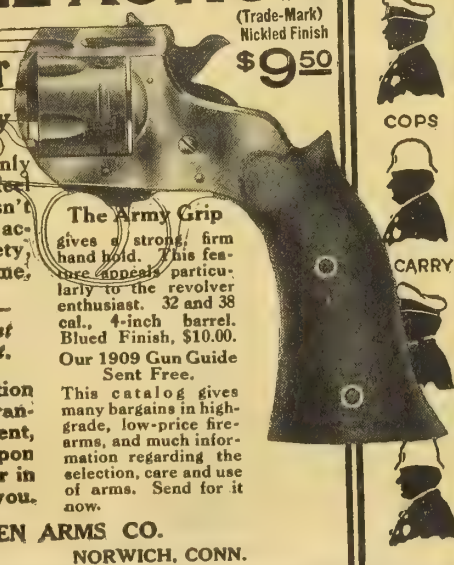
Safety Police Revolver

Insures Absolute Safety



The third or safety action is so plainly a safety action that a blind man can feel it and know it when he feels. It isn't an-added-on mechanism. It's the action of the revolver that secures safety; positive, perfect safety all the time.

It shoots when you want it to shoot—quick and hard. When you don't want it to shoot, nothing can make it.

This is the best revolver proposition on the market. A revolver guaranteed to the fullest extent. Sent, charges prepaid, to any address, upon receipt of price. If there's a dealer in your locality, ask him to show it to you.

The Army Grip gives a strong, firm hand hold. This feature appeals particularly to the revolver enthusiast. 32 and 38 cal., 4-inch barrel. Blued Finish, $10.00.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

nice lather and add a little powdered borax and rub the scalp vigorously with the fingers. When the hair seems clean, rinse through two waters of the same temperature as the first and with a little borax in each, as the borax not only softens the water but has an excellent effect on most person's hair, making it soft, glossy and increasing its growth. If possible dry the hair in the sunshine and dry with a clean, soft towel. When the head is once clean it should be kept so, and should be protected while sweeping or riding in the dust.

To keep the hair in waves, moisten with the white of an egg mixed with cold tea, then put upon waves, and the well beaten white of one egg mixed with half cup of cold tea is the right proportion. Keep the hair strands clean by frequent brushing using a brush of firm, fine bristles which will go through the heaviest locks, and when brushing and comb-scalp, and for the sake of the hair if not for cleanliness, combs and brushes in daily use need frequent washing.—A. M. H.

BEDS AND BEDDING.

There is not enough thought given to the daily care of bedding, and in this as in other things, the matter of health should be considered of paramount importance. The bedding should be removed a piece at a time and carefully spread over chairs before open windows, and every child should be taught to throw off the covers the moment he leaves the bed that the exhalations from the body may escape instead of being absorbed by the bed and bed clothes. It is a good plan to keep a whisk broom hanging in a convenient place and brush the bed and mattress every two or three days to keep them free of dust. If any bugs are found on the bed, try quicksilver as it is one of the best remedies for these insect pests. First wash the slats and sides of the bed with strong salt water and let it dry, then take the white of one egg to one ounce of quicksilver and put together in a large plate and beat with a fork until the egg absorbs the quicksilver; then apply with a feather or small brush to every crack and crevice, and this quantity is sufficient for two or three beds. White counterpanes look better than any other outside covering and the best way to clean them without hard rubbing, is to wash out the most soiled places in warm suds and then put them to soak over night in warm soft water to which a small cup of coal oil has been added. In the morning fill a tub two-thirds full of warm rain water and stir in enough pearline to make a good lather, then wash clean and rinse through two waters with a little starch and bluing in the second and dry in the sunshine, and they will need no boiling unless they have been allowed to become very soiled or yellow. They will come through the cleaning process a beautiful white if the cleaning is carefully done, and they look best if they are ironed on the wrong side over a table or board covered with a heavy blanket, as this throws out the pattern and takes away the rough look they will have if they are not ironed. —M. A. T.

IMPATIENT SUSIE.

"Oh I can't thread this needle, ma,"
Was little Susie's cry;
"Just as the thread is going through,
The needle winks its eye."
—October Woman's Home Companion.

BUTCHER BOY'S VALENTINE.

Deer heart, I'm in an awful stew
How I'll re-veal my love for you.
I'm such a mutton-head when you're near,
I know it's only cow-ardice
That makes these lamb-entations rise,
I dread a cut—let me explain:
A single roast would give me pain.
I should not like to get the hooks,
And dare not steak my hopes on looks.
I never satisage eyes as thine.
If you would but-cher hand in mine
And live-r round me every day,
We'd seek some ham-let far away;
We'd meat Life's frowns with Love's caress,
And cleav-er road to happiness.
—Maurice Smiley.

MORE WETNESS, PLEASE!

It isn't time
Just yet to quit;
We've only had
A little bit.
So kindly take
This timely hunch,
Another bunch
Of wetness, and
We'll whoop it strong,
And chant your praise
In happy song;
We'll tune 'em up
In sweetest strain,
If you will give
Us some more rain.
Just give us one
Immense downpour,
And you'll not hear
A kick nor roar.
But please, oh please
Don't make a bluff
At it; we've not
Had half enough.
—E. A. Brininstool.

Well! How much does Brininstool want?

HOUSEKEEPING.

Women are asking how they can make housekeeping easy and more pleasant; and this applies to the ranch as well as to the town woman. Many women are not willing to use poor, slow methods of twenty-five years ago, when there are many better ones in use. It is true that our grandmothers were busy women, for they had to make the carpets, candles, preserves, salt the meats, make the clothing, knit the mittens and hoods, and do almost everything else that was needed in the home. The factories of today have taken from the home many of these industries. In the old training the daughter helped her mother with the work, but this practice is no longer as common as it used to be. On account of modern utensils and conveniences the real housework is less, but more and better management is needed in the housekeeping of today. The day will come when the housekeeper must know the easiest and most systematic way of doing things. Ninety-five per cent of the food we eat is prepared by women. Brains must be used in planning foods for people in the house, and a mother should know how important it is to have suitable food and to have it well cooked. We study the needs of animals in our barns and in our public parks, and we should be just as anxious about our children.

It is impossible to overestimate the importance of proper feeding in childhood; it is the first few years that count. Children sometimes dislike certain food, but a tactful mother can do a great deal. Does it not seem that every mother would be willing to give good, wholesome, simple food to her child for the first ten or fifteen years of its life, knowing that it means good health, good teeth, and a good stomach for the rest of the child's life?—Mary F. Rausch, Colorado Agricultural College.

Mrs. Homer:—"I can't understand why that woman who just moved next door spends so much time with her pet dog."

Mr. Homer.—"Oh! then you haven't seen her husband."

"Philosophy iz a fust rate thing to hav, but you kant alleviate the gout with it, unless the gout happens to be on sum other phellow."—Josh Billings.

HE PREFERRED ONE GIRL.

When J. M. Barrie, the author of "Peter Pan," addressed an audience of a thousand girls at Smith college during his American visit of last year, a friend asked him how he had found the experience.

"Well," replied Mr. Barrie, "to tell you the truth, I'd much rather talk a thousand times to one girl than to talk one time to a thousand girls."

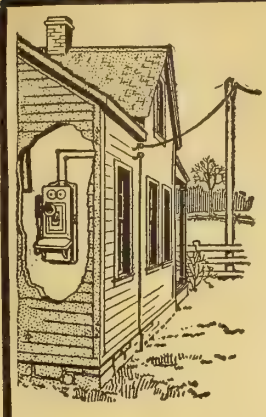
Mother.—"I am sorry to hear that Tommy Smith tied a kettle to a poor dog's tail. You wouldn't do such a thing would you?"

Bobby:—"No, indeed, mother."

Mother:—"Why didn't you stop him, Bobby?"

Bobby:—"I couldn't, mother; I was holding the dog."

"What have you got in the shape of cucumbers this morning?" asked a customer of the new grocery clerk. "Nothing but bananas, ma'am."



Rural Telephones

Do you realize that rural telephones, more than anything else, tend to increase the earning power of every farm and farmer? Do you realize that

ALL of the material needed to build the very best rural telephone line—exactly the same as the Bell Company puts up—will cost you and your neighbors less than 20 bushels of wheat each?

Over 4,000,000 Western Electric Telephones

are in use in the United States to-day. We made the first telephones and we have made the most—in fact, we have made more than all other manufacturers combined.

We have brought the rural telephone within the reach of every farmer, and with our Free Bulletins before him a boy can install and operate the system. Our telephones are guaranteed.

Cut out this advertisement, write your name and address on the margin and mail it *to-day* so that the Free Bulletins, which describe the entire plan in detail, may be sent you immediately.

About the House

Under the above head Elbepe will regularly conduct a department filled with helpful suggestions for the home maker. Some will refer to the work of the kitchen, some to the parlor, some of a more personal nature. All will be of value and will, we trust, aid in creating more of a "family feeling" in the Cultivator household. Do our readers wish information, or if a helpful suggestion for others is in hand, send it in to Elbepe, care of the Cultivator.

THIS year is made memorable by a remarkable series of centennial anniversaries. Tennyson and Poe and Oliver Wendell Holmes, Mendelssohn and Chopin, Darwin, Gladstone, and Lincoln, what a list of great names. Poets, musicians, scientist and statesmen. On February 12, the American people everywhere will reverently celebrate the one hundredth anniversary of the birth of Abraham Lincoln, our great war president, and one of the greatest statesmen, not of America alone, but of the world.

"Our children shall behold his fame,
The kindly-earnest, brave, far-seeing man,
Sagacious, patient, dreading praise, not blame,
New birth of our new soil, the first American."

* * *

A clever club woman has formulated a "rule of four" that will, if properly applied, make easy many tiresome household tasks. The "rule of four" is—"Simplify, Beautify, Jollify, Glorify." Try it and see if it will "prove."

A prize recipe for cooking prunes is to wash one pound of prunes in several waters, nearly cover with water, and let stand for ten or twelve hours. Cook very slowly until tender and just before taking from the stove add a large tablespoonful of sugar.

* * *

These winter evenings some of us Californians have had many a pleasant evening at "our club." It has no other name, but it has been the means of several hours pleasure every month for all of us, and that means all the family, father, mother, boys and girls, two or three grandmothers and grandfathers, aunts and uncles and a baby or two, all the members of eight or ten neighboring families. Every other Friday night we meet at the home of some member of the club and the host and hostess for the evening furnish the entertainment and the entertainment covers everything—something to amuse, something to instruct and something to eat or drink. We do have good times these evenings—no two the same—and the oldest and the youngest and all in between go home with a contented feeling at their hearts. One hostess who had a large kitchen had a candy party. Another evening we had the old songs, and the young people found that "rag time" songs were not the only ones worth hearing. This evening the hostess served the old fashioned seed cakes and a cup of tea with lemonade for the youngsters. One evening the children of the "club" furnished the entertainment,—Mother Goose sitting in her shoe at one end of a long room. She heard the complaints of all her family. Little Bo Peep told of her lost sheep, Mother Hubbard of her bare cupboard, Little Boy Blue,—all came to tell "Mother" of their troubles. Some of the little folks sang the songs as the various characters came forward. We have several good story tellers in our neighborhood and one of the most delightful evenings was one of stories, one after another. I can't begin to tell you of the many good things we have enjoyed together, young and old. In these busy days we are too prone to go each his own way and thus parents and children drift apart in tastes and aims.—Elbepe.

ABSURD.

Don't think because
You have a grouch,
The whole wide world
Should bellow "Ouch!"
—Birmingham Age-Herald.

COLT ACETYLENE Gas Light

The Produce Markets

Los Angeles Markets

LOS ANGELES, Feb. 10, 1909.

Butter.

Butter has declined 2½ cents on extras during the week and with freer transportation from the North will probably make a further decline. At present the market is firm with light receipts.

Produce Exchange wholesale quotations are as follows with actual selling price to the trade 2½c advance on Extras.

Creamery ex per roll	.75
Firsts	.70
Eastern extra per roll	.70
Cooking	.23@25
"Butterine"	.16@20

Cheese.

San Francisco Markets

SAN FRANCISCO, Feb. 9, 1909.

Butter.

Butter is very firm and has advanced materially during the week. Present condition will prevail until warmer and more settled weather prevails. Receipts are light. With settled weather and resumption of transportation a material decline will probably come.

The official quotations of the San Francisco Wholesale Dairy Produce Exchange for today are as follows:

California extras per lb	35
California firsts	32½
California seconds	28
Ladles extra	23½
Storage Cal ex	31

Cheese.

California flats fy	14
Firsts	12½
Cal Young America fy	16½
Firsts	16
Seconds	11½
Young American Oregon fy	16
Eastern N. Y. Cheddars fy	17
Oregon flat fy	14

Eggs and Poultry.

Eggs have declined 3 cents on extras and all other goods show a tendency to the regular spring decline. No particular weakness prevails but receipts are much heavier.

Official quotations of the S. F. Wholesale Dairy & Produce Ex. are:

Citrus Market

LOS ANGELES, Feb. 10, 1909.

Heavy shipments of oranges striking an Eastern blizzard made a bad combination and indifferent prices are prevailing at this writing. The recent storm in California will retard shipments and thus correct the glut. Weather conditions in the East also promise well so that normal shipments will soon be resumed it is hoped. Florida has cleaned up practically all her oranges.

Lemons are facing the biggest importation in years. Lemons now in market and afloat, shipped since the Sicily disaster, make the lemon market look rather serious. Fortunately the trade has learned the superiority of the California lemon and will pay more for it than the imported. This with freight from the Eastern seaboard to the Middle West points enables some lemons to be disposed of without great loss.

Shipments.

Shipments of oranges since November 1, 1909, to date aggregate 5,137 cars; of lemons 1,169 or a total of 6,306 citrus fruits.

NEW YORK, Feb. 9.—Fifteen cars navels and five cars lemons sold. The market is slightly lower in spots. There is a very active demand for navels. Lemons easier and lower. Cloudy, threatening.

Phones, F1917. Broadway 1264.

America's Best

The Model Acetylene Gas Generator

Manufactured by the National Welding and Mfg. Co. of Buffalo, N. Y.

Why it is the best:

1. Perfect in design and contruction.
2. All operating parts conveniently located.
3. All piping entered through one casting on exterior of machine being easily replaced if necessary.
4. Most scientific carbide-feed ever built.
5. Best purifier in the best location.
6. Residuum faucet discharges downward.
7. Simple safety locking devices.
8. Simplest machine to understand and operate.
9. Permitted by fire insurance authorities.
10. Sold under a positive guarantee.

Racine-Sattley Co's. New Govenor Disc Harrow

We sell this disc harrow under a very strong Guarantee. That it will do as good or better work than any disc harrow on the market, or your money back.

Of what good is a disc harrow unless it will penetrate? We spend thousands of dollars in grinding and polishing our harrow discs, and in putting them through several operations of special preparation, which do not enter into the preparing of the discs for other makes of disc harrows. Thats why the New Governor harrows are held as the standard of quality by most ranchers today.

10-18 inch discs—5 foot cut—complete with pole and 3 horse equalizer, $36.00.
12-20 inch discs—6 foot cut—complete with pole and 3 horse equalizer, $40.00.
16-20 inch discs—8 foot cut—complete with pole and 4 horse equalizer, $46.00.

Order at once. If we receive your order before February 20th, we will pay the freight charges to any point within 75 miles of Los Angeles. Address:

SOUTHWEST SUPPLY CO.

127 South Los Angeles Street, Los Angeles, California

Exclusive Agents for the Celebrated Racine-Sattley Line.

FOR SALE--SECOND HAND MACHINERY

Are you looking for bargains in any kind of machinery? We have goods that are good and prices that are right.

BOILERS—Vertical boilers from 2 H. P. up to 25 H. P.; return tubular boilers from 15 H. P. up to 125 H. P.; firebox boilers from 12 H. P. up to 40-45 H. P. Every one of these boilers has been tested with cold water pressure, and they are all complete.

ENGINES—STEAM—Steam engines from 2 H. P. up to 250 H. P. These engines are all fitted up and ready to run.

ENGINES—GAS AND DISTILLATE—One 6 H. P. horizontal, one 8 H. P. horizontal, one 8 H. P. vertical, and up to 50 H. P. All complete with battery, tanks, etc.

DRILLING RIGS—Two water well drilling rigs, with or without tools; one hydraulic water well rig, with or without tools; two light standard oil well drilling rigs, 4-inch and 4½-inch irons; two heavy standard oil well drilling rigs, 5-inch shaft.

PIPE—10,000 feet of pipe and oil well casing, all sizes.

MISCELLANEOUS—Two 2-ton chain blocks, two small water heaters; one 3 H. P. motor; 100 wood and iron blocks, all sizes, one sheave to three sheave; 12 pairs of new chain tongs; 8 screw jacks; 5 tons of pipe and casing fittings; one No. 2 vertical centrifugal pump; one No. 4 horizontal centrifugal pump.

We guarantee all our goods to be as represented, OR YOUR MONEY BACK. All orders promptly filled. Write or telegraph us for prices.

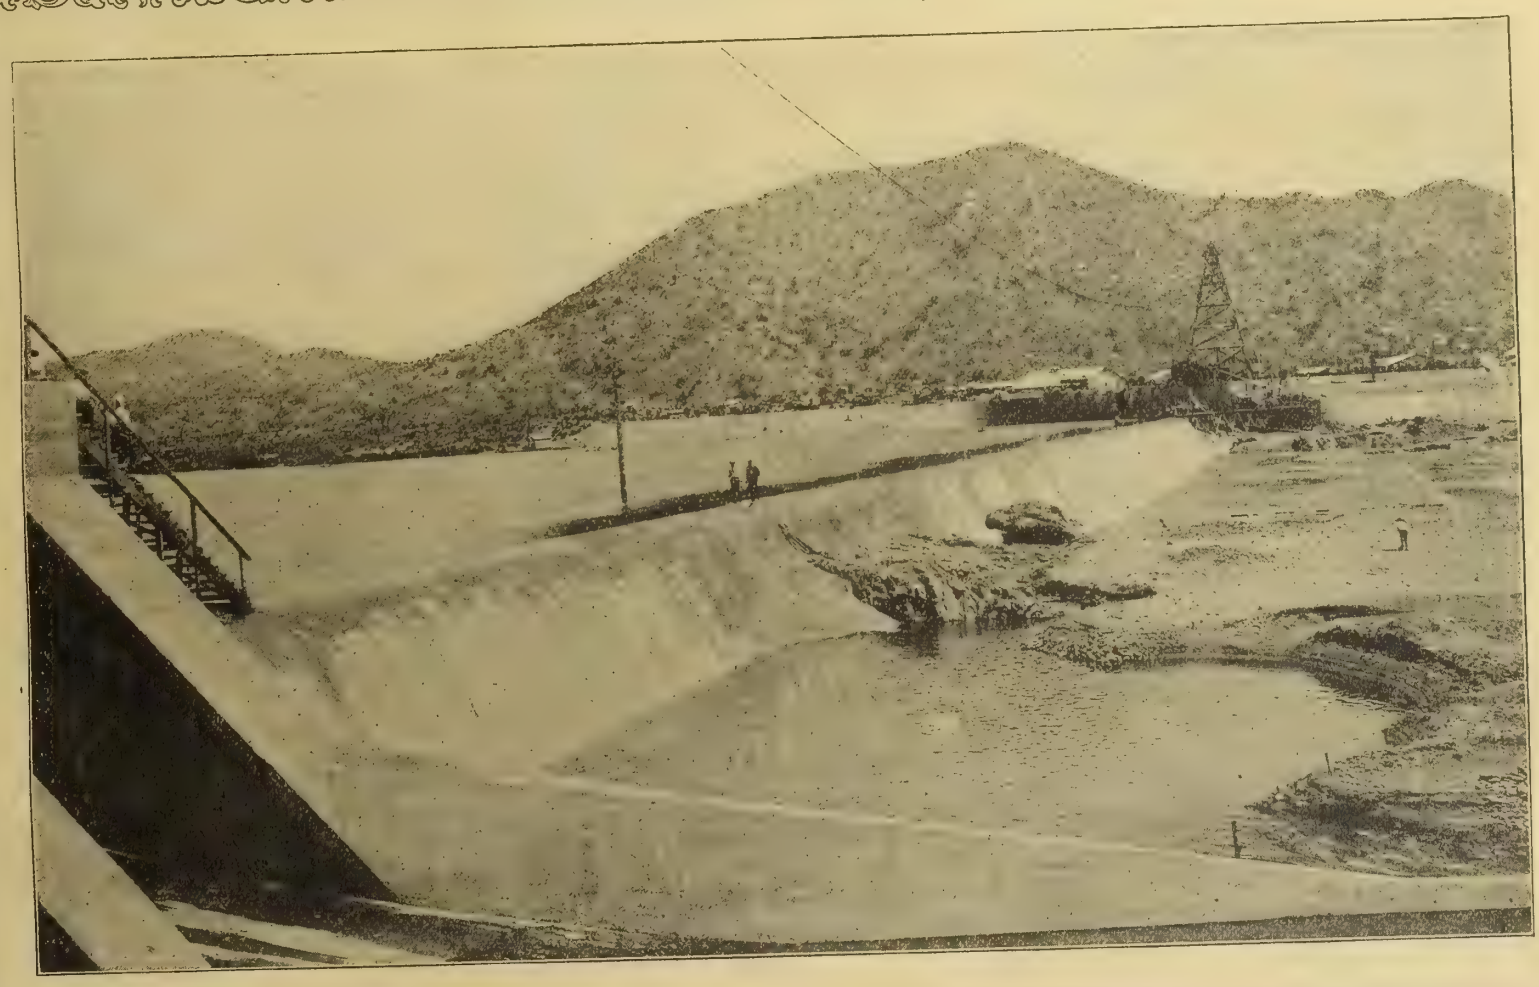
Published Weekly — One Dollar a Year

Los Angeles — February 18, 1909 — San Francisco

Granite Reef Diversion Dam

A Salt River Valley Improvement in Connection With the Great National Irrigation System. This is for Diversion of Waters Which Will Be Stored by the Great Roosevelt Dam



THOUGH the Tonto Basin water storage dam is of prime importance, almost as useful in its own way is the concrete diversion dam lately completed by the Reclamation Service at Granite Reef, about twenty-five miles east of Phoenix, below the mouth of the Verde river.

This new dam is 1440 feet long upon its crest, its greatest height being 26 feet. All, save a few well-protected feet in the center, is set firmly upon bed rock. At either end are immense diversion gates. Over the dam will go any floods that may come down the Verde River in the years that must elapse before that erratic stream, like its greater neighbor, the Salt, shall have been dammed for storage.

The structure at the Reef cost about $500,000, a sum assessed against the land to be benefited, service being given to main distributing canals on both the north and south sides of the valley. On the north side, by payment of $314,000, the Government already has been given possession of the canals and works of the Arizona Water Company. The uppermost canal of this system, the Arizona, is being enlarged by dredging to a carrying capacity of 80,000 miner's inches, a veritable river's flow of over 700,000 gallons a minute. The main canal almost skirts the mountains that fringe the valley on the north, its terminus on the plain at the Agua Fria river, twenty miles northwest of Phoenix and forty miles from the dam.

Ask the WIFE
SHE WASHES IT

TRADE Sharples MARK 29 Yrs

Washing the Sharples Dairy Tubular bowl. Only three pieces. The brush, the girl is using, cleans the inside in a moment. Easier washed, more durable than any other bowl.

Your wife knows the difference between washing one dish and washing **forty-two.**

Why not let **her** choose between the light, simple Sharples Dairy Tubular Cream Separator bowl—with just one tiny, plain piece inside, as shown in the upper left hand picture—and the heavy, complicated "disc" or "bucket bowls" shown in the lower right hand picture?

Show her these pictures, made from actual photographs. Ask her which cream separator bowl she would rather wash? She'll put her finger on the Tubular every time and thank you for saving her needless labor.

You will appreciate the many exclusive advantages of the 1909 Tubular "A" Cream Separator.

You will like the low supply can, single frictionless ball bearing supporting the bowl, entirely enclosed self-oiling gears and ball bearing, the plumb bob attached to the frame for quickly leveling the machine and keeping it level, the single piece frame and the great simplicity of the entire machine.

Put your heads together and talk this over. You'll agree that the 1909 Tubular "A" is the finest cream separator money can buy.

She Will NOT Want These

What woman would choose to wash any of these heavy complicated "bucket bowls" when she can have a simple Dairy Tubular instead? What man would expect any of these complicated "bucket bowls" to be as durable as the simple Dairy Tubular?"

This is the Sharples 1909 Dairy Tubular "A." So simple and perfect in construction, that the medium sizes can be turned by one who is seated. Self oiling enclosed gears. Low, steady supply can. Plumb bob attached for quickly leveling the machine.

Tubulars Are Entirely Different From all Others

Built on 29 years' experience, in the world's greatest cream separator factory. 1908 sales way ahead of 1907—way out of sight of any other make, if not all others combined. Write for complete catalog No. 260.

President Roosevelt on Country Life

Extracts from the President's Message to Congress When Transmitting the Report of the Country Life Commission

"JUDGING by thirty public hearings, to which farmers and farmers' wives from forty states and territories came, and from 120,000 answers to printed questions sent out by the department of agriculture, the commission finds that the general level of country life is high compared with any preceding time or with any other land. If it has in recent years slipped down in some places, it has risen in more places. Its progress has been general, if not uniform.

Discontent in Country.

"Yet farming does not yield either the profit or the satisfaction that it ought to yield and may be made to yield. There is discontent in the country, and in places discouragement. Farmers as a class do not magnify their calling, and the movement to the towns, though, I am happy to say, less than formerly, is still strong.

"It would be idle to assert that life on the farm occupies as good a position in dignity, desirability and business results as the farmers might easily give it if they chose. One of the chief difficulties is the failure of country life, as it exists at present, to satisfy the higher social and intellectual aspirations of country people. Whether the constant draining away of so much of the best elements in the rural populations into the towns is due chiefly to this cause, or to the superior business opportunities of city life, may be open to question. But no one at all familiar with farm life throughout the United States can fail to recognize the necessity for building up the life of the farm upon its social as well as upon its productive side.

"From all that has been done and learned, three great general and immediate needs of country life stand out:

(Continued on Page 207.)

Hot Beds and Cold Frames

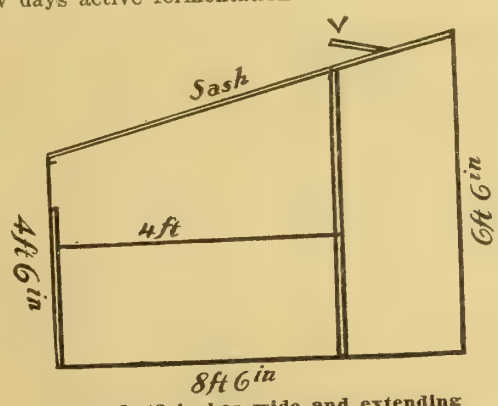
Valuable Information on Construction by Q. A. Lobingier of San Gabriel

A cold frame is simply a frame having sash, but no other means of heating. The function of a cold frame is to ward off cold winds, and in the spring to increase the feeble heat of the slanting sunbeams, and thus foster plant growth. The construction of a cold frame is very simple. The back board is usually 12 inches and the front 8 inches wide. The two are connected by a tapered board 12 inches wide at one end and 8 inches at the other. Sash are usually made about 3x6 feet. Many use 6x8 or 8x10 glass, but I have always prefered 10x12 putting three rows to the sash and making the glass 12 inches wide in each row. This makes a sash a little wider than three feet but that is no disadvantage as the frame can be made to suit.

Fill the frame with mellow soil to within 6 inches of the top in front and 8 or 9 inches at the back; make shallow drills three or four inches apart across the face of the soil in the frame, and in these sow the seeds, covering them thinly and tamping them lightly; then water moderately with a fine sprinkler. Put on the sash and keep all snug until the seedlings appear, when the sashes should be tilted up during the day to admit air. This airing must not be neglected for a single day or your plants will become drawn and weak. As the seedlings get strength the sash can be removed both day and night in fine weather but replace as a protection against cold or wet weather. As soon as the plants are large enough transplant into the open garden. In sowing seeds in a cold frame be careful to plant such as are of similar strength and time of germinating. I have often put divisions in the frame so that the different kinds could be treated according to their needs. Another way is to make the bottom of the frame perfectly level and then sow the seeds in flats. Those that germinate first can be given the most sun and air.

Hotbed.

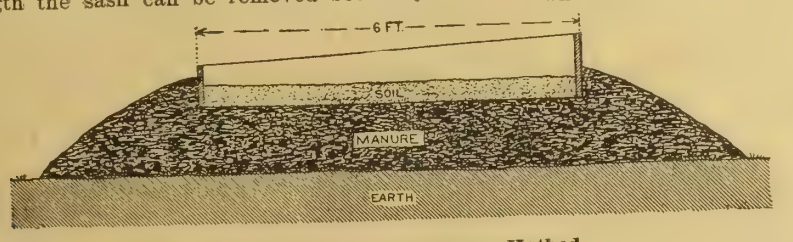
A hotbed is simply a cold frame placed upon a quantity of fermenting manure. In the preparation of the manure it is best to collect the requisite amount from the horse stable and make it into one compact heap, watering it if dry. In a few days active fermentation will be in progress,



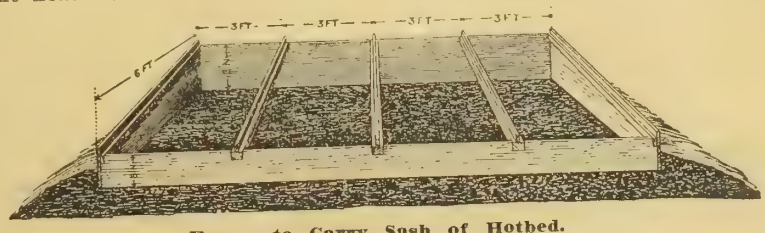
A board, 12 inches wide and extending the entire length, made in sections of 10 feet and hinged, is used as a ventilator. Shown open at V.

when the heap should be turned, watering again if necessary and shaking out the lumps. The aim is to induce an active and uniform fermentation of the whole mass, and to have it continue for some time after the soil is placed upon it.

Select a place where water will not stand and when the manure is in violent heat the second time, make it into a regular uniform layer eight or nine feet wide by whatever length is necessary, with a depth of twelve to fifteen inches. Tramp the manure firmly and evenly. Place the frame on it. Then put three or four inches of good soil uniformly over the surface. Some manure or soil can be placed against the frame on the outside to the height of four or five inches which will aid in retaining the heat. Put on the sash and keep tight for three or four days. Plunge a thermometer into the soil and when it recedes to 90 degrees it will be safe to sow the seeds. Some gardeners sow when a thermometer placed in the hotbed—not in the soil—shows 75 degrees.



Cross-section of a Temporary Hotbed.



Frame to Carry Sash of Hotbed.

Beginners are impatient and often fail by sowing in a heat that is too violent. The temperature should not be allowed to go above 70 degrees in the daytime nor below 50 at night, after the seeds are sown. When the hotbed is new it is well to always keep a chink of ventilation on to allow the discharge of steam or ammonia. Otherwise the seedlings will damp off. Beginners will find it safer in the management of a hotbed to place but about two inches of sand or soil over the manure and sow all seeds in flats or pots or earthen pans. Always raise the sash for ventilation at the high side of the frame. The hardening off and transplanting should be followed just as in the management of the cold frame.

Gardeners who are regularly in the work will find a leanto propagating house very much more satisfactory than the hotbed. I have one 30 feet long on the south side of my dwelling that I find indispensable. The sketch shows it so plainly that explanation is hardly necessary. A galvanized iron pan 2x3 feet and three inches deep serves for rooting cuttings. A hole two inches less in size than the area of the pan was cut from the stage and the pan set over it and the pan filled with clean sand. Four inches underneath the pan a sheet of iron nearly as large as the pan was suspended and beneath this, in the center, I use a small oil heater, when I want bottom heat. About four feet is partitioned off with burlap to partially confine the heat and burlap hung in front next to the walk. With this simple, inexpensive arrangement I can start the most tender seeds or root cuttings in great variety. I found the prices asked for making sash at the planing mill so high that I adopted the plan of having the mill work out the sash bars in lengths of say 14 feet and having them put together with 10 and 20 penny finishing nails. Any good carpenter can put them together in that way and make a stronger job than by the methods the mills use. Be careful to select soft redwood that will not warp or split.—Q. A. L.

POTASH

The largest, juiciest, sweetest
ORANGES

are those that have been most scientifically fertilized. No other fruit makes more exacting demands on the soil. The use of **Potash** in the fertilizer gives extra size, firmness of flesh and most delicious flavor—fruit which repays the cost of the Potash many times over in better market prices.

Potash is Profit

and should be used for the largest profit at the rate of 20 lbs. **Sulphate of Potash** in each 100 lbs. of fertilizer.

You should read our free booklet, "**Orange Culture**," which contains information indispensable to every orange grower.

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

With the Citrus Growers

ARIZONA CITRUS SECTIONS.

"ONE gets a somewhat broader view in visiting other sections, and it is a liberal education as well. My trip to Arizona certainly gave me a new insight into the resources and development of that wonderful region and I came home with an added respect for the enterprise and public spirit of the people of our neighboring territory."

This is the statement of Horticultural Commissioner R. P. Cundiff, who returned last evening from a trip to Phoenix, where he went as guest of the Arizona Orange Growers' Association to look into the matter of insect pests in the groves of the Salt River Valley and to work for a national quarantine law.

"I found no scale in the groves about Phoenix," said Mr. Cundiff, "but there is, of course, constant danger of its being admitted, and a bill has already been introduced into the territorial legislature providing for the inspection of all nursery stock coming into the territory and the destruction of such pests as are found in the groves. It takes some time for scale to get a start and Arizona has been favored in this respect. It took fifteen or sixteen years for black scale to get acclimated in Riverside, and it would eventually find lodgment in Arizona if infected stock was admitted. I saw no red scale, though climatic conditions there would favor it. The growers are alive to the matter of keeping scale out and will work for a national quarantine law as well as state and county laws.

"The orange industry is now going through the transition stage that Riverside experienced in its early days. I saw one or two model groves that were well handled and had splendid crops. Culture methods have not been what they should have been and as a result the greater number of the groves are not producing the crops that they should. There has been practically no fertilization and in many instances there has been no cultivation of lands after irrigation for an entire season. Water is usually run in big heads every fortnight, the land being flooded during the twelve hour run. Methods are being improved and all seemed eager to learn.

"The navels grown in the Salt River valley are certainly very choice. There are only about 600 acres from which fruit is being picked, but 400 acres more are being planted out this season. Some of the Valencias I saw in one of the better groves were as fine as the Chapman product.

"It is estimated that with the private water plants now in operation with the two great federal irrigation enterprises nearly completed, the Tonto and Laguna dams, fully a million acres will be irrigated in Arizona. Of this amount 200,000 acres are in the Salt River valley, a little empire in itself. The region about Tempe has not yet gone into the government irrigation district, but private irrigators about Phoenix are converting their rights into government rights. I understand that the government water rights cost $30 an acre. Water at present is being furnished from Granite Reef dam, 27 miles north of Phoenix.

"The people of Phoenix are singularly progressive and loyal to their city. I didn't strike a single knocker on the trip, but every man appeared to be a booster for his community, a condition that will keep Phoenix well to the front. The roads about the city are generally good, but in street improvements the city is behind Riverside. The city has splendid educational facilities and good stores. I arrived at Phoenix Thursday and was taken for an auto drive over the country. I addressed a meeting of growers, at 2:30 and in the evening attended a banquet at Hotel Adams, which was attended by members of the Board of Trade, Commercial Club and Orange Growers' Association. Among those who spoke were Prof. R. H. Forbes, in charge of the Agricultural Department of the University of Arizona; Prof. J. E. Colt of the Agricultural Experiment Station, and B. J. Jones, formerly connected with an experiment station in Southern California.

At Yuma I had an opportunity to see the Laguna dam, which is to furnish water for an immense area of land, both in California and Arizona. The dam is 4980 feet long, constructed of rock and cement, and has harnessed the Colorado river very effectively. It is located 14 miles above Yuma and the main flow is on the California side, being syphoned across the river to the Arizona side. It is now figured that 10,000 acres of the Imperial valley lands can be irrigated from the Laguna dam. This is land that at present is not irrigated."—Riverside Press.

The Fertilization of Citrus Groves

From an address by J. H. Norton, who has charge of the fertilizer experiments at the Riverside Experiment Station.

THE subject of fertilizers is one that the wisest men feel timidity in discussing, because of the many conditions which surround the use of fertilizers having made the specific results and information gained rather limited. Our agricultural crops are so nearly alike that there is not a wide difference in the fertilizer requirements of the various crops. We mean by a fertilizer some specific substance that is beneficial to the crop production. Since all plants feed through the leaves and roots we must look to these two points for fertilizer effects. It is commonly recognized that a fertilizer is an element which the plant needs as a food. In other words, the plant's food supply is deficient in this particular element. But some recent investigations show that certain substances may have a neutralizing effect on an excessive food supply of a certain element and be a fertilizer by reason of its negative action. At any rate, under the subject of fertilizers may be considered nitrogen, phosphorus and potassium.

Nitrogen exists in an endless num-

ber of combinations. As the element of free nitrogen it exists as four-fifths of the atmosphere. It exists as the nitrate in nitrate of soda, nitrate of potash, etc. It exists as the ammonium salt in household ammonia, sulphate of ammonia, sal ammoniac, etc. Nitrogen is one of the elements in protein compounds or organic nitrogen. Free nitrogen is used by plants after certain bacteria convert it into nitric acid. These bacteria live best in combination, or as we say in symbiosis with leguminous plants, furnishing the legume nitric acid while the plant furnishes a home for the bacteria in the nodules on the roots of the plant.

In bulletin 180 of the New Jersey station we find that a ton of dry cow peas has gathered from the air 109 pounds of nitrogen and deposited it in the soil crop. But two succeeding millet crops on this soil after the peas have been plowed under show that this 109 pounds of nitrogen is only equivalent to 14.5 pounds of nitrogen from nitrate of soda applied as fertilizer, or 14.7 pounds of nitrogen from dried blood, or 9.3 pounds of nitrogen from sulphate of ammonia, or 5.9 pounds of nitrogen from stable manure.

That is to say, that the nitrogen accumulated by one ton of dry cow peas from the air into the soil is worth about $3 to follow the peas by millet, under New Jersey conditions. Nitrogen is the element in most explosives which gives them their explosive property. Nitrogen is very inert and hard to hold in a compound and for that reason there is great loss of nitrogen in nitrogenous fertilizers.

Any form of nitrogen is a fertilizer. Free or atmospheric nitrogen, as well as any form of organic nitrogen, is available to higher plants only after certain bacteria have converted the nitrogen into an available form. There are two available forms of nitrogen for use of the higher plants; ammonia salts and the nitrates. Only a very small amount of ammonia salts is taken up by the plants as plant food. The bulk of nitrogen taken up as plant food is in the nitrate form. Therefore we must give our trees nitrates or some form of nitrogen that we know will become a nitrate at the time and rate the tree will need it.

Phosphorus exists in almost an endless number of combinations. This element is quite different chemically from that of nitrogen and for that reason requires quite a different consideration as a fertilizer. The only form that phosphorus is important as a fertilizer is the form of a phosphate. As a phosphate it is always in combination with calcium or lime, there being four different combinations of the phosphate and lime. These four different forms differ in their solubility. The mono-calcium phosphate, or superphosphate, is soluble in water, the dicalcium phosphate or reverted phosphoric acid is soluble in ammonium citrate solution and both of these phosphates are commercially known as available phosphoric acid. The tricalcium phosphate, or apatite, is the insoluble or unavoidable phosphate and known commercially as unavailable or insoluble phosphoric acid. The tetracalcium phosphate is found in Thomas slag which is sold in this state as Thomas phosphate powder. This powder is more soluble than the tricalcium phosphate and less soluble than either of the other two. Then the order of their value would be as follows. Mono-calcium phosphate, dicalcium phosphate, tetracalcium phosphate, and tricalcium phosphate.

The nitrates are not fixed in the soil and for that reason they are subject to loss by leaching as well as loss by the denitrifying bacteria which are continually setting the nitrogen free to get back to the air. The phosphates are not lost by reason of volatile products being formed, nor are they appreciably lost by leaching.

The phosphates on being dissolved on or near the surface of the soil are carried down into the soil and fixed in what is known as an insoluble form. But this distribution of the phosphates, owing to their solubility, is far better done than we can do by mechanical means and for that reason the soluble phosphates are worth more as a fertilizer than the insoluble, even though they are converted into the insoluble form in the soil.

Potassium differs from the other two elements in forming but one class of compounds in commercial fertilizers, the potassium salts, all of which are soluble and available for plant growth. Potassium does not form volatile combinations and is fixed in the soil as phosphates are fixed. The transformation of nitrogen from its various forms into available plant food seems to be very well understood, but just what reactions take place with the other two elements is not so well known. It is undoubtedly true that phosphorus and potassium in the soil are acted upon by the products of organic decomposition and nitrification, including various organic acids, carbonic acid and nitric acid.

Nitrogen as a fertilizer is found in the forms of nitrates, ammonium salts, blood, tankage, bone and manures. Other forms of nitrogen may be in use in other parts of the country, such as cotton seed meal and indirectly alfalfa, etc. The value of these different forms of nitrogen from the two standpoints, that of the producer and that of the consumer, is an important question and will in the near future receive quite different attention from what it has received in the past.

The availability of the different forms of nitrogen is about as follows: Nitrates, 100; ammonium salts, 90; linseed and cotton seed meals, 75; blood, 70; bone and tankage, 60. The availability of manure seems to be one that is not as well worked out. The sources of phosphorus are that of phosphate rock, Thomas slag, bone, tankage and manure.

As to the amounts of fertilizers to use on citrus groves, would suggest for the sake of opening a discussion, that on trees in full bearing use one to one and a quarter pounds of nitrogen per tree per annum; potash, one or two pounds and phosphoric acid three to four pounds.

ORANGES IN CUBA.

"The orange crop this year is the largest ever produced in Cuba," said Max J. Bacher, United States Consul at Cienfuegos, Cuba. "A conservative estimate of the number of crates, I should say, is 500,000. It was only a few years ago that large quantities of oranges were shipped to Cuba from Florida and California, but for the last three years these shipments have decreased in size, and will probably stop entirely within a year. Americans control a large part of the orange industry in the island, and they have been responsible for the big increase in production. Orange cultivation, in fact, did not begin until eight or nine years ago, and is yet only in its infancy."—Fruitman's Guide.

TADPOLES AND FROGS.

The metamorphosis of toads and frogs is one of the most marvelous processes in nature and gives us a hint how other animals that now always live on land once came out of the water, for all land animals show evidence of having descended from water animals.

As the young tadpole grows the hind legs appear; a little later the front legs begin to grow also, but they cannot be seen, for they are under the skin; the tail begins to become smaller, and it is not lost bodily, but is absorbed probably by the action of the white blood corpuscles. The material of which the tail is composed is broken down by the white blood corpuscles and either carried into the body or allowed to pass into the circulation, and is probably used by the cells of the body as food, much as the camel's hump disappears during a fast. Since changing from water to land depends mainly upon a change in the method of breathing, this is of the greatest importance.

The true gills mentioned above are covered by a fold of the skin, called the operculum. Water is taken into the mouth and passed over the gills and out through a hole on the left side of the body called the spiracle. In the meantime there has grown out from the alimentary canal, just back of the gills, a pouch, having its own blood supply, which will later become the lung. As the tadpole approaches the time of metamorphosis the mouth broadens, the alimentary canal shortens, the legs grow larger, the tail disappears, and the frog is ready to come on to the land. The use of the lungs is not taken up suddenly, however, for the tadpoles have been practising at long breathing for some time previously. They come to the surface of the water and gulp in air, which they seem to need on account of the gradual disappearance of the gills.—Ohio Agricultural Bulletin.

Planet Jr.

The Planet Jr. Orchard and Universal Cultivator does more work and does it better than any other implement for the same purpose. Carries attachments which thoroughly cultivate, furrow and hoe at any required depth in orchard, vineyard, or hop-yard. Equipped with side-hitch and fruit-tree shield. Can be made into a disc cultivator. Made by a practical farmer and manufacturer, and especially adapted for your work. Thousands of Planet Jr. Cultivators are in successful use in California and other fruit-growing districts.

We carry stock in San Francisco. Agencies in all principal Pacific Coast cities. Write for name of nearest agent.

Write today for our new 1909 catalogue of 45 kinds of Planet Jr. implements for every farm and garden use.

S. L. Allen & Co., Box 1106P, Philadelphia, Pa

The roof that proves; sun-proof and rain-proof; needs no paint or repairs.

Pioneer Rubber Sanded Roofing is its own best advertisement—answers every need, where a sun-proof, rain-proof roof is required. Write for samples—and beautifully illustrated booklet.

Pioneer Roll Paper Co. Department 11 Los Angeles, California

DEAD CITRUS WOOD

Is more or less prevalent in every orange and lemon grove, i. e., trees that are unprofitable. How many such have you in your orchard? Would it not pay you to put paying trees in their stead?

Your Home Grounds

Should contain at least a few trees of the better varieties of oranges and lemons. For this purpose we have some exceptionally fine trees to offer, being grown as specimens. Possibly you would like to plant a few citrus trees about your home this season. If so, will you do us the favor to correspond with us about it?

Citrus Fruits

**Historically,
Horticulturally,
Commercially.**

Our new booklet gives more valuable information about varieties, methods of planting, cultivating, pruning, picking, packing and shipping than anything of its kind ever issued. Sent anywhere for the small sum of 25 cents. Correspondence a pleasure.

ANSWERS TO QUERIES.

The Cultivator takes particular pride in the fact that it has amongst its regular paid force of contributors some of the brightest people in the state of California in their various callings. They not only furnish regular contributions for the paper but answer queries which may be sent in showing the needs of our subscribers. These answers we believe are amongst the most valuable features of the paper. And from the number of queries which are received weekly we believe our subscribers are of the same opinion. The prominence which has been given to these contributors by their work has been such, however, that they are often imposed upon by personal requests sent directly to them asking for personal replies through the mail. We imagine Mrs. Sherman must have several letters every day coming to her home with request for personal and immediate answer. One who has never been similarly situated has no idea of the time the answering of such letters takes from one's life. We therefore request all subscribers who have questions which they wish answered to send them direct to the office of publication in Los Angeles. The questions will then be classified and often one answer will answer for several queries and the time of our contributors will not be so heavily drawn upon.

Another point which we wish to enforce in this place is for query writers to sign their full name. We scarcely ever use the full name. We never do where requested not to. But notwithstanding this request which appears in every issue of this paper no week passes but we receive communications with questions to be answered, unsigned or signed only by initials. These are usually consigned to the waste basket, notwithstanding they often contain questions which are perfectly legitimate and regular. No self-respecting paper ever pays attention to anonymous communications.

SHORT COURSE.

The recent short courses held under the auspices of the State University Farm at Davis brought together a number of bright young men from farms in many parts of the state and is the start, we hope, toward much better work and more extensive work to be taken up in this state in the near future. The present attendance at the High School on the same farm is disappointing for, as one farmer has expressed it, there are but about as many students as there are instructors. This shows the need of greater appreciation on the part of our young agricultural people for better knowledge of agriculture. For the sake of comparison we may refer to the recent short course held at Ames, Iowa. The classes in that course aggregated a total membership of over 800 scholars, all there for a good hard two weeks' work to fit them to bring Iowa farms up to a higher state of culture. Iowa is an older state and, agriculturally considered, it may be admitted that it has been a larger state than California. But the difference in these two institutions is altogether too great. Of the 800 students enrolled at the Iowa short course, 53 contested for the seven Armour scholarships which were won by the Iowa state college at the last international stock show. When the University of California fully understands the needs of the agricultural young people of this state and fits itself to meet these needs along the various lines of agriculture and horticulture it is possible our young people will rise to the occasion and show more interest than they have in the past. We trust such will be the case for the future prosperity of the state agriculturally depends on more perfect knowledge of the science of agriculture.

A MORE PRACTICAL EDUCATION.

The following which was taken from La Follette's preaches a very emphatic sermon on the advantage of more practical agricultural education in our schools, so emphatic, in fact, that we think it does not need any comment or moralizing:

"A man who stuttered badly went to a specialist and after ten difficult lessons learned to say quite distinctly, 'Peter Piper picked a peck of pickled peppers.' His friends congratulated him upon this splendid achievement.

"'Yes,' said the man doubtfully, 'but it's s-s-such a d-d-deucedly d-d-d-difficult rem-mark to w-w-work into an ordin-n-nary c-c-conversa-sation, y'know.'

"This reminds us that much of the education of the schools has been d-d-d-difficult to work into life. Perhaps that is the reason why we are trying something more practical; manual training and domestic science, farm and trade schools, and agricultural colleges."

The milch cows of the United States increased from 21,194,000, which was the number January 1, 1908, to 21,720,000 on January 1, 1909. The average valuation during the year increased something over $2.00, amounting to $32.36. On the contrary, beef cattle showed a decrease during the year of about three-quarters of a million head, the total number now being 49,379,000, with an average valuation of $17.49.

Swine have increased materially in average valuation during the past year, reaching an even 50 cents per head higher than January 1, 1908. At that time the average valuation was $6.05. January 1st, this year, $6.55. In this country there were, this year, 54,147,000 head, a decrease during the year of about two million head.

FARM LIFE.

A short extract from the message of President Roosevelt to Congress at the time of his submitting the report of the Country Life Commission appears on the first page of this week's Cultivator. It is well worth reading.

It is noteworthy that the President calls attention to the great benefits which will accrue to the farmer through the establishment of parcels post, organization of farmers, co-operation and other factors. There is nothing in the message which would show the President's idea to be for a moment that of giving aid or a charity to the farmers. On the contrary it is more that the farmers may be encouraged through co-operation, organization, parcels post and other activities to assert his rights, together with an uplift in social and intellectual life which may come with better opportunities in the rural schools.

The President makes a good suggestion that an appropriation of $25,000 be made that the work of the commission may be carried on to a successful conclusion and that the facts it has been delving into may be classified so that its lessons may be made of value.

TIME EXTENDED.

Because of the fact that irrigation works which have been performed under the direction of a National Reclamation Service, have been more extensive than anticipated when the act empowering such work was first passed, the National Congress is considering a bill which will extend the time which land owners may have to pay for the great cost of such irrigation plans. There are some sections of the country in which the ten-annual-payments plan necessitates an annual payment of $3 to $4.50. The big Roosevelt dam in Arizona calls for the land to pay at least $3 per acre each year. This may seem a small amount, but when it is considered that this land is to be taken largely by people of very small means who as a rule will have to make their living from the land as well as make these small payments it may be realized that if the amount of the annual payment can be decreased a great number of people of small means will be greatly benefited.

The act calls for the extension of time from the original ten years to twenty years with no interest from the settlers.

TREES FROM FLORIDA.

As was noted in the news column a bunch of trees shipped to Visalia from a nursery in Florida was destroyed by the Horticultural Commission of that county, because, as is well known, no living plant is permitted to enter from that state since the discovery of the white fly here showed the magnitude of the danger which exists. The infestation of the orchards at both Marysville and Bakersfield was traced directly to the importation of stock from Florida. No fruit-growing state which considers its own welfare could for a moment permit the further introduction of trees and plants from a state where the danger is so great. Yet, with this knowledge, there are fruit growers willing to jeopardize not only their own but the greatest interests of horticulture by endeavoring to ship in plants from that section.

The promptness with which this shipment was destroyed will probably prevent any possible introduction of the pest. While it is probable that those particular plants may not have been infested, yet the rule has been made so rigid that no plants whatever are admitted. This is wise and we trust horticultural commissioners and others of the state will be as vigilant as were those of Tulare county.

FARMERS INSTITUTE TRAIN.

Prof. W. T. Clarke writes from the Demonstration Train that the improved train service which is now given, over that of the first trip over the Sacramento valley, aids in creating an extraordinary interest and has given a great value wherever the train has gone. He adds: "We believe that its importance can hardly be over-estimated." The train will soon make its initial trip in Southern California.

Agricultural Notes of the Pacific Coast

Northern California

Northern coast counties have already had well up to five feet of rain.

The Board of Supervisors of Sonoma county have appropriated $150 to aid the Cloverdale Citrus Fair.

The Central Creamery will soon begin the operation of a condensing plant at Ferndale, Humboldt county.

Mendocino county wool men maintain that wool will command a better price next year than it has in the past.

Gov. Gillette is urging the adoption of a good roads plan by this state, which will bond the state for $18,000,000.00.

The appropriation for the State Dairy Bureau of California aggregates $5,000 per year; that of Pennsylvania $33,250 per year.

Dairymen of Humboldt county have protested against the placing of the work of the Dairy Bureau under the State Board of Health.

Farmers of Colusa and Yolo counties are discussing with more vigor than ever the necessity of proper protection from storm waters.

At the State Experiment Station at Davis two durum wheats have been found which may be grown on land too dry to produce common wheat.

The Eel River dam in Mendocino county stood the recent floods notwithstanding it carried more water than was ever seen over it before.

One farmer near Suisun is experimenting in quite extensive planting of shell bark hickory. He thinks California can produce a good hardwood.

Thousands of cords of wood will be gathered on some of the farms along the Sacramento river, brought down by the drift during recent floods.

One great advantage from the Iron Canyon reservoir now building by the government, will be the holding back of a portion of these storm waters for use in the dry season.

Hay is selling at $40 per ton in Weaverville, Trinity county. The heavy snows in the mountains have compelled stockmen to drive their cattle into town to feed in corrals.

The suggestion to build the suspension bridge over the Carquinez Straits has been superseded by a suggestion to tunnel in order to carry the products where the ferry boat now runs.

Senator Caminetti has introduced a bill in the State Senate providing for a consulting board on mining debris which it is said will be greatly to the detriment of the agricultural interests of the state and in favor of the miner.

The agricultural exhibit train accompanying the traveling Farmers Institute was made ready at the State Farm at Davis and is now touring the San Joaquin Valley. There will be two exhibit cars on the train instead of one as on the former trip.

The annual meeting of the stockholders of the Grizzly Bluff Creamery Company resulted in the election of the following officers: President, G. W. Sweet; vice-president, Charles Decarli; secretary, H. F. Harbers; treasurer, W. N. Church; manager, James Lawson.

Central California

The total precipitation at Delano aggregates 5.71 inches.

The crane fly is doing such damage in the pastures near Lodi.

Visalia is the latest in the Farmers Union column and with a good strong organization.

The hunting licenses of last year showed a material decrease over those of the preceding year.

The Wasco farmers are engaged in a new endeavor for that section in planting ten acres of onions.

The Kings County Chamber of Commerce has a fine display of citrus fruit in the rooms of the organization.

The apple orchards of Greenfield, Monterey county, are proving to be bearers of some exceptionally fine fruit.

The Supervisors of Monterey county are contemplating a concrete bridge on the road between Chualar and Gonzales.

Kings county farmers are complaining of the depredations of coyotes and suggesting a heavier bounty for their scalps.

The apricot scale at Greenfield has been controlled to a large extent by the colonization of a colony of Scutellista cyanea.

Raisin growers have suggested that the stores of the valley make a special raisin day sale at which the raisins shall be offered at low figures to consumers.

Articles of incorporation have been filed in Stanislaus county by the Eucalyptus Growers and Manufacturers Company. The company is capitalized at $250,000.

California legislature has passed resolutions urging other states to hold in abeyance legislation against sulphured fruits until the final report of the special Roosevelt commission.

The Santa Clara valley is growing less of the Longworth strawberry than formerly and is going to other varieties. This is occasioned by a lack of breeding up, or of allowing the Longworth to run out.

Dried fruit men over the San Joaquin valley are watching with much interest Dr. Wiley's effort to secure a duty on sulphur which will make it so high priced that it cannot be used in sulphuring the fruit.

Many of the best people of Fresno county appeared before the State Legislature and appealed for the establishment of a normal school at which future teachers of the state might be given instruction in agricultural matters.

It is believed that the storing of grapes and keeping them until winter market will be so satisfactory that millions of dollars will be added to the wealth of the state through the encouragement this will give to the great industry.

The third annual meeting of the Stanislaus County Farmers' Mutual Fire Insurance Company recently held at Turlock brought forth the report that during the last year about $80,000 worth of new insurance had been written. Directors for the coming year are: Mons Bothun, C. J. Lundell, Peter Erickson, Antony Morgan, S. J. Booge and C. G. Main.

Southern California

Extensive plantings of deciduous trees are being made at Moorpark, Ventura county.

The Highland orange growers have sold more fruit f. o. b. cars this season than ever before.

The water in the Hemet dam rose four feet in height as a result of a 5½ inch rainfall recently.

A new orange packing house at Nordhoff has just been completed and found to be entirely satisfactory.

Farmers of the Antelope valley are incensed at the destruction of trees in the Government Forest Reserve.

Walnuts are moving out more rapidly than for some weeks and an early clean-up is now anticipated.

It is claimed that there will be nearly 16,000 acres of beets planted in the section near Oxnard factory.

A light frost caught some of the earlier melons planted in Imperial and will delay the earlier shipments.

An automobile beet cultivator has been constructed and will be tested in the Chino sugar beet fields this season.

Long Beach is planning the beautifying of its city and to that end has secured plans from Charles Mulford Robinson.

A San Diego county rancher is engaged in planting 4000 acres of eucalyptus trees. It is located about six miles south of Escondido.

An immense land-slide on the coast line delayed traffic between Los Angeles and San Francisco several days during the recent storm.

The big Santa Fe pre-cooling plant planned for San Bernardino it is now announced will be delayed in its construction for nearly a year.

Bean growers of Ventura county are receiving about $3.50 per hundred pounds. Most of them are holding crops hoping for better prices later.

The Imperial Standard estimates that there will be not far from 3000 acres planted to cantaloupes this year. This will be much less than last year. Most of this acreage will be about Brawley.

The Southern California Co-Operative Dairy Association, one of the largest co-operative milk handling concerns in the state, now receives from its members about 50,000 pounds of milk daily.

The Southern California Dairy Association will soon have a home of its own in Los Angeles. It will cost about $25,000 and will have complete equipment of the latest improved machinery for handling milk and cream.

An action brought by J. R. Newberry of Los Angeles to secure the waters of the Santa Ana for use on lands at Rincon, Riverside county, has been decided after seven years litigation in favor of Orange county litigators who had filed on same waters.

The onion growers of Coachella valley have found their onions better keepers on the eastern markets than those shipped from the humid sections and they hope this season to reap increased rewards for their stock. They will largely go forward under the new brand "Salton Sea Brand, Grown in Rainless Belt."

The Coast

Eggs at Portland are still commanding 55 cents per dozen.

The winter school of farming at Pullman, Washington, attracted more students this year than ever before.

The oat fields of Skagit promise one of the most remarkable yields since the settlement of that section.

The state of Oregon needs a new irrigation law and an effort will be made to get one passed by this legislature.

The Interstate Poultry Show at Clarkston, Washington, made an exhibit of 300 fowls which were of a very high grade.

Farmers at Helena, Montana, who began action against the smelters at Anaconda, have been defeated and will get no damages.

Hawaii is endeavoring to keep out the scabby disease of potatoes, and to that end will admit no potatoes which show any effect of scab.

Fruit growers at Council, Idaho, recently held an annual apple day meeting at which time officers were elected for the coming year.

The annual joint meeting of the Montana Horticultural Society and the State Farmers Institute is being held at Missoula this week.

Preparations are practically completed for the great Trans-Missouri Dry Farming Congress which will convene at Cheyenne February 22-25.

The second annual meeting of the Hawaiian Bee Keepers Association, which met a few weeks ago in Honolulu, showed much interest in that industry in the Islands.

The Hawaiian bee keepers will make an exhibit at the Alaska-Yukon exposition, a part of which will be large photographs showing bee keeping scenes in the Islands.

Hawaiian Islands exported to California last year for use of the Santa Fe Railroad Company 2,500,000 ties. Hawaiian Islands are experimenting extensively in new varieties of eucalyptus.

The fire patrol of the government reserves in Washington has suggested the use of Angora goats for keeping the fire breaks free from chaparral growth after once it is grubbed away.

The Yakima valley and some other sections of Washington showed an egg famine to the extent that about the first of the month eggs were commanding fifty cents or even more per dozen.

Speculators at Salem, Oregon, are concerned over a decision of the Supreme Court which prevents them from using certain waters on land for irrigation purposes which is needed for domestic use.

The sugar beet is more of a staple product in Northern Colorado than ever before and is becoming more of a standard. The factories there paid farmers last year between five and six millions of dollars.

The local board of control of the National Irrigation Congress is appealing to the Legislature now in session for an appropriation of $30,000 to finance the Congress to be held next summer at Spokane.

Observations on Walnut Pruning

The following, written by Walter P. Temple of El Monte, states a condition of some walnut trees which should warn all walnut growers. The condition with attendant fungous growths and insects is fatal to the health of the tree and should never be permitted. But Mr. Temple's conclusions that he describes "walnut blight," is plainly in error. Blight has been proven to be a bacterial disease and is not due to poor physical condition of the tree.

AS A subscriber of the California Cultivator, and as one much interested in horticultural matters, I beg to submit to you the following article on "Walnut Pruning and a Possible Cause of Walnut Blight." I have 33 acres planted to soft shell walnuts on the old Temple Homestead at the old Mission in Los Angeles county. The soil, as is usual in this portion of the San Gabriel valley, is a sandy loam. I have about 800 trees which are 15 years old and are planted about 43 feet apart. They are good yielders and seem to be perfectly healthy.

The same principle in pruning applies to walnuts as to other trees, namely that the trees want judicious thinning out from time to time and should go to fruit and not to wood. The pruning should be fairly close to prevent unsightly knots and the subsequent growth of wild wood about their extremities. The practice of pruning trees with an axe as followed by some of my neighbors is reprehensible. You cannot do justice to your trees in this way. Unsightly cuts and stumps will appear, and in making a false cut you are apt to permanently injure your trees. Besides, to many parts of a tree an ax would be inaccessible. Use a saw, a good pair of pruning shears, and a light, portable ladder about three feet in height, with a top platform 14 inches square, upon which you can stand and work with comfort. You will then do a finished job which should be the aim of every horticulturist. Six years ago I had my trees pruned fairly close, necessitating the cutting of many large branches. These cuts I had painted over with thick paint to fill up and cover all small open spaces.

Three years ago my pruning was merely confined to the new growth and last year many large branches were cut away. This year some new growth was cut out, and drooping branches trimmed so as to permit of easy cultivation of the ground.

In pruning this year I have made the following observations which may be of use to walnut growers. I found that the six year old cuts, though in some cases presenting a fair exterior, were invariably diseased; and that these diseased, damp portions were honeycombed and literally full of animal life, consisting of peculiar, long, thin, whitish worms, three fourths of an inch in length, and great borers; ants with dark brown extremities and a yellow body; an insect resembling an ant, but larger and more compact; several of the large insects of a most peculiar aspect, and myriads of infinitesimal bluish mites, impossible for me to describe or classify. Prof. Smith of the Whittier Pathological Institute has classified as follows: Termits or White Termopsii, or Soldier King; Carpenter Ant—Camponotus; Wire worms—Elateridae; Carabidae Larva; Carabid Beetle; Millipedes; Lepidoptera Larva.

Becoming satisfied that this array of enemies might prove a menace to my trees, with hammer and chisel I cleaned out all these rotten cavities, full of animal life, some several inches in depth and extent, and have filled these with cement, which scheme insures the destruction of the insects remaining and the strengthening of the tree.

I believe if copper sulphate or any similar solution were injected into these cavities before cementing, it would be still better.

Every walnut branch or twig having a long, pithy cavity about its center presents a vulnerable spot to dampness and insects which every careful pruner should provide against. For this would seem to be a great point of danger. To insure against this danger at times of pruning, plug every cavity with a wooden plug, or fill with cement and then paint over with a coat of thick paint. Neglect this cavity from year to year and it will grow larger, winter rains will penetrate and, in time rotting take place. Then follow insect pests without number which burrow into the tree and limbs and eventually destroy it. Gradually the limbs and twigs become diseased, the leaf, blossoms and fruit are blemished, and in time the branch perishes entirely. And why may not this blemish be the walnut blight?

I notice that in all old cuts the lower portions are invariably decayed; and the upper parts are in many cases quite solid. This is in line with my theory that rain and moisture enter the central cavity; in time this exterior part dries and cracks, which cracks radiate from this center; that these small cracks admit more water, that gravity settles the water in the lower part; rots this locality and then it becomes the home of insect pests above described. It is also my observation that diseased fruit, leaf and limb occur at the lower part of the tree and not at the top; which shows that the top not being pruned, or very slightly, does not offer openings for borers and pests, but that the lower part being pruned and the pithy cavities left open and exposed, become infested with these enemies which do their work injuring limb, leaf and fruit, and bring on that condition known as "walnut blight."—Walter P. Temple, El Monte.

Dipping nursery stock in lime-sulphur wash or other insecticides has recently been much advocated as a substitute for fumigation with hydrocyanic acid gas. The Station at Geneva, New York, finds, however, that this treatment, if used at all, must be handled with care to secure scale destruction without injuring the trees. With sulphur wash, exposure of the trees for too long a time or at too high temperature resulted in injury; while with any of the materials used, exposure of the roots to the mixture resulted in serious injury to the stock. For nurserymen, the Station still recommends fumigation as most effective and least liable to injury; and would advise orchardists to use the lime-sulphur as a spray after the trees are set, rather than as a dip when they are received.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

THE MILK.

The bitterness that appears in the milk during the winter season is attributed by the farmer's wife to frosted alfalfa—to feeding the cows on green barley; indeed, everything is blamed but the true cause—that is bacteria. Temperature is the only thing that needs watching in these cases. The development of these bitter bacteria comes at a temperature a little too low for the regular souring of the milk by the lactic acid bacteria. The keeping of the cream in a warmer place will remedy the trouble. This same cause of chilling affects the bread; it does not rise properly, for the yeast plant, like the lactic acid bacterium, only grows at a temperature not lower than 60 degrees. The yeast plant is even more sensitive than the lactic acid one in that it dies at 85 degrees. How simple this all seems when we know the facts we are dealing with to be those tnat govern the growth of the plant world around us, not fairies and witches and the like things that we have no control over.

Soured Milk.

The use of either artificially soured milk or the natural produce of the churn, butter-milk, is at present a helpful health fad. The drug houses are selling extensively tablets, containing a form of bacteria to sour milk, or to make it into a form of butter-milk. The simple diet will help many people and if to it could be added the restful quiet and fresh air of the country the gain of health would be greater. The bacteria used are from a culture that is used by the people of the steppes of the Baltic country and has great effect in curing intestinal troubles. The bacteria infesting the internal organs are destroyed and replaced by this harmless one. That butter-milk possesses mild antiseptic properties has long caused its use in typhoid fever and other diseases of the bowels. Ordinary soured or clabbered milk is less digestible as the curd is in larger masses. The digestibility is increased when sour milk is added to the butter-milk and well churned with it. This adds to it the quality of broken curds and finely divided masses of casein are more readily acted upon by the gastric juices.

Bloody Milk.

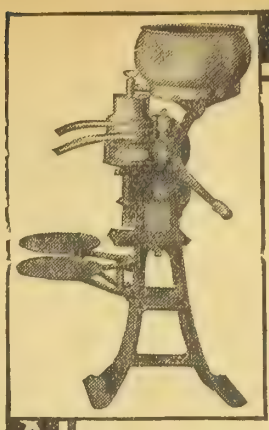
The cause may be bacterial by the infecting of the milk duct, as it is carried into the milk and developed into bloody clots in the bottom of the pans. This is a rare occurrence, too rare to be considered of much value in seeking a cause for the trouble in the ordinary dairy. The usual causes are careless jerking of the teats in milking, use of sticks in driving the cows, butting by the other cows with horns. I often wonder at the irritability of the cows toward one another. They will punch from behind the cow walking in front of them if they have horns to do it with. Now when blood is found in the milk try to remove some of these causes. Sometimes a fresh cow that gives an excessive quantity of milk will give for a few weeks bloody clots in her milk. This usually passes away when she settles down to a regular milk flow. These cases must be considered as either the bursting of a minute blood vessel that quickly heals or else it is a lack of proper transfusing of the material of the blood into milk. The supply of material that forms milk is directly from the blood. How milk is made we really do not understand but we do know that the milk veins of a cow carry blood, not milk, and the milk is formed as it is drawn from the udder.

The Udder.

Trouble of the udder from bruises can be readily detected if this organ is carefully examined. The old remedy for udder trouble, given internally, was a teaspoonful of sulphate of iron and a teaspoonful of ground gentian root twice a day in the grain feed. This remedy should not be used when a cow is far along with calf as it might prove dangerous to her. Nowadays, however, we have learned to recognize that local troubles of the udder are best treated by fomentations of hot water, steaming, or the rubbing on of hot lard. When there is persistent inflammation of the udder it is safer to test the cow for tuberculosis than to let her go on being a constant care.

Gentleness.

Humanity in handling the cows should be considered from the higher plane of loving all things God has made. Where this thought is not strong enough to appeal to the heart, then the lower motive of more milk and more money from gently treated cows may be talked about to the men. We must sell to the cow the privilege of doing her best if we cannot grant it from love and affection A new milker, that is gentle, will the first couple of times he milks the string get a noticeable reduction in the milk. It is only as the cows come to know him that they will increase in milk. The healthfulness of milk drawn from a nervous, fretted cow is less than from a contented animal. I know of a case where the milk from an abused, terror stricken cow produced nearly fatal results in the child using the milk. The farmer's wife and child's mother had milked the cow; the time came when she could not do so and then a neighbor offered to care for the cow and share the milk. The little three year old daughter had been fed milk from this cow for some time. Suddenly the child became alarmingly ill, the milk was discontinued for a few days, when it was resumed the child again sickened, the doctor at once suspected the cow. The farmer's wife went to see the cow and found her wild eyed and crouching in the stall. She asked why this gentle cow should act like that. The neighbor replied, the cow kicked at him and would not let down her milk but he had fixed her all right; he just batted her a kick or two in the belly every time he milked and it laid her out all right. The cow was taken home and treated with



EASY IN EVERY WAY
SKIMMING WITH AN IMPROVED DE LAVAL

Skimming milk with an improved DE LAVAL cream separator is an easy, simple matter from start to finish. Getting the machine ready, filling the supply can, turning the crank, and cleaning when through are all done with the greatest ease and convenience.

Every part of the DE LAVAL machine is designed for easy operation. The bowl construction permits of its being very compact and small in size and requiring but low speed. The length and height of the crank handle are just right for easiest turning. The method of gearing is the product of perfect engineering. Thus the necessary speed is maintained with the least continuous effort on the part of the operator.

Some separators are so designed as to run deceptively easy when starting, but greatly tire or strain the operator in a half hour's use. The DE LAVAL turns easy from the beginning to the end of a run. Scientifically correct mechanical construction throughout is the reason for it.

The improved DE LAVAL machine is so simple in every feature that an inexperienced person could if necessary take it apart from top to bottom in five minutes, and put it together again within ten minutes. There is no need of expert knowledge or hard work in operating a DE LAVAL machine or handling any of its parts. It's "Easy in Every Way."

Our illustrated catalogue explains DE LAVAL simplicity and ease of operation in detail. Let us send you a copy, or better still, try a machine for yourself in your own dairy. You have but to ask for either.

31 Years Old

Get The Facts

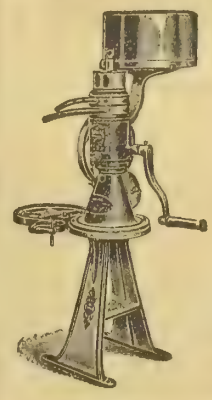
The Roller Bearings
You Pay Your Money
And Take Your Choice

There's only one Spreader that has had a test of over 30 years. It is up to you to say whether you will invest your money in that machine or some other.

The 31-Year-Old Success Spreader

has proven itself on tens of thousands of farms. It has worked under all conditions. It has had all kinds of handling. It has a record for good work, right working and durability that is not approached by any other spreader. It is the one roller-bearing spreader—chain driven, free from gear wheels, least friction, least breakage, lightest draft, strongest. Equipped with either wooden or metal wheels as desired. You might as well have the Success Spreader. Get all the facts and you will buy no other. Catalog Free.

KEMP & BURPEE MFG. CO., SYRACUSE, N. Y.



The Empire

Why is it the Empire Cream Separator is so universally used all over the United States? There must be a reason for it! If you will send for a catalogue and investigate you will see for yourself.

Its close skimming, light running, easy cleaning, simplicity, and durability are the points the people are looking for. The best all-round cream separator for the Ranch!

Send for our new 1909 catalogue.

kindness; no further trouble was experienced with the child.

Rights.

In this day of claiming for rights of all kinds the cow must claim hers too. How simple they are! A clean bed, enough food and gentle treatment. During this season of high priced foods there is a natural tendency to save. This is commendable, but let it take the form of saving on the cigars and smoking tobacco and on the saloon bill; it will, then, not affect the cows as they are not interested in these items. The greatest fault in the feeding at this time will be the chance that the sire is not given enough heavy food. If he is not fed as well as the cows, he will fall below their standard of physical vigor; the next crop of calves will run to veals instead of to heifers. The efforts of nature to preserve the species will throw the balance of sex to the weaker side. It is often remarked that the service of the town bull gives a larger number of heifer calves than the herd sire. The town animal is fed on grain, groomed and exercised the same as a horse, while the dairyman's animal usually gets what is left over and is kept in a small corral fighting flies all the summer days.—M. E. Sherman.

HOG KILLING ON THE FARM.

Some people do not feed their hogs the evening before killing, thinking the feed is wasted, and that the entrails are more likely to get ruptured when too full. I feed our hogs the night before killing. They are hungry as usual, expect the feed, enjoy it, and it seems cruel not to give them their last supper. There is not much waste if the entrails are emptied where the chickens can get at them.

Some men knock their hogs down with a club before sticking, others think it more humane to shoot them with a rifle before they are stuck. I have some doubts whether hogs will bleed out completely when knocked on the head or shot before sticking. Others throw a box over the hog, then tip the box over with the hog in it lying on his back, legs up. We catch our hogs in the pen, put a rope around one hind leg and drive them to the place of slaughter. I put the rope on the leg because, as I have fed them and cleaned the pen, they are not suspicious of me as they are of strangers, and I can rope them quicker than a stranger, from whom they are sure to run.

When arrived at the sticking ground the hog is thrown down and rolled square on his back; the knife is inserted just forward of the breast bone and close to it, then thrust back in the direction of the tail. This is sure to sever the big arteries in the neck and insures a "good stick," which causes the hog to bleed out more quickly and thoroughly, and the pork will keep better. In sticking a hog lying on his side the sticker is quite likely to thrust the knife under the shoulder blade and cause the blood to settle there, to the injury of one shoulder. A hog will bleed out cleaner if the head is kept on lower ground than the tail. In the great slaughter houses in Chicago the hogs are never stuck until after being hung up by one hind leg on an iron rod overhead. After being stuck they go slowly sliding down the rod to the place where they are lowered into the scalding tank.

The most important thing about butchering (as every farmer knows) is to get a good scald, so that the hair can be easily and quickly removed by the scrapers. It is better to have the water too cold than too hot, for a "cold scald" can be remedied by an application of hotter water; but a scald with the water too hot "sets" the hair so that the skin, being cooked, will scrape off with the hair, making it necessary to shave off the hair with a sharp knife, doing a poor job and requiring much time. Some butchers think they can tell the proper temperature of the water by putting their hands in it, which is rather doubtful. The exact temperature can be secured every time by the use of a thermometer. For large 300-pound hogs 170 degrees is about right. For small hogs and pigs the water should not be above 150 or 160 degrees, and then they should not be kept in the bath too long.—Country Gentleman.

DAIRYMEN SHOULD KEEP BOOKS.

Probably the most expensive error usually made by our farmers is the failure to keep books that will enable them, at any time, to tell whether they are doing business at a profit or loss. Many of our farmers can't tell at the end of the year whether they have made money or lost money. Should any other business be conducted in this manner, nothing but failure would be expected.

"It is extremely doubtful whether there is a single herd of cattle in South Carolina that does not contain some animals that have never produced one dollar profit for their owners. Probably most of our dairymen can, at the end of each month, estimate the cost of food and labor for the month, also the total receipts for the month, and in this way they can tell whether they are making or losing money. But even if the business is always found profitable, that is no reason why we should not be constantly on the lookout for leaks, because one unprofitable cow in the herd had far better be sold at beef prices than kept in the herd to reproduce her kind and continually reduce the profits of the dairy.

"By the use of milk scales, the milk sheet, and the Babcock test, the dairyman can cull out every unprofitable animal from the herd with but little trouble and expense, and at the same time determine, at the end of each month, what his total profits are."

A pair of suspension scales is recommended and are to be adjusted so that the empty pail will cause them to stand at a balance. The milk sheet can be made by any farmer, and is ruled so as to contain a space for each cow and a space for her milk each day. Then the bulletin says.

"At the end of each month, the sheet should be taken down and each column added up, the totals being entered at the bottom. We have then not only the total amount of milk produced by each cow for the month, but the daily record, which will enable us to observe any changes in the flow from day to day, caused by change in feed, change in weather, etc.

"So much for keeping the records. If we are producing butter or cheese, or selling milk that is guaranteed, we must know what per cent of butter fat the milk from each cow contains or we are still in the dark as to what she is producing.

"All dairymen know that there is a wide variation of butter fat in the milk from different animals, therefore some simple, practical method of de-

termining the amount of butter fat in milk becomes necessary. We have this in the Babcock test, which is simple enough for any intelligent man to use accurately and at a very small expense."

The bulletin goes on and gives complete directions on how to take a sample of each cow's milk so as to know to a certainty just what she is as a milk and butter producer, and also the process of operating the Babcock test.

If the recommendations of the bulletin are followed out it will be of vast benefit to the dairymen of any State.—Bulletin of South Carolina Station.

RESTING THE COW.

It is always wise to give the cow a rest between periods of lactation, says Orff's Journal. Just how much she should have may depend on the age of the cow, her condition and the character of work she has been doing during the present period of lactation. Our practice has been to breed all young heifers, intended for the dairy herd young, that is so they will freshen right at two years of age. This starts them in on their life work of producing milk while they are yet young and discourages the habit of laying on fat from the use of their food. But at this age the heifer has not attained her full maturity and undoubtedly she should have a rest at an early date so she will have an opportunity to grow. To encourage persistency of milk flow she should be milked for a full year because what she does the first year she is likely to try to do each following year. To accomplish this end we postpone rebreeding her for four or five months so she may milk all year and still have a month or two to rest, grow and develop her body before starting in on another year of hard work. The older cows are always given from three to six weeks' rest between periods of lactation, but are bred so they will milk all year and then have the rest. Often a cow will become quite fleshy toward the latter part of her lactation and by this signify that she does not need a rest, in which case she will be kept milking up to within a week or two of calving. In other instances a cow will work very hard and toward the close of the year become quite poor in flesh. In this case she should be turned earlier and thus be allowed to rest and recuperate.

During the year the cow consumes a great lot of feed and as a result the digestive apparatus is subjected to strenuous work and when the cow is turned dry this portion of the body may be rested by changing the feed. If in summer, the best of feed will be good fresh pasture grasses, and if in the winter, corn silage, bran, oil meal, ground oats, and similar feeds. During the last two months of the period of gestation the foetus or young calf is making its largest growth and all this growth is given to it by the dam, and if at the same time she is working hard at the pail it cannot be expected that she will do the best by the youngster that is to come. Then, too, if the cow is given a rest and fed well during the time she will store up flesh, strength and stamina that will aid her greatly during the next period of lactation, especially at the beginning. Careful observation on the part of the dairyman will reveal that, other things being equal, the cow that freshens in a strong, fleshy condition will milk heavier and her milk will test richer than the cow that works right up to the end and freshens in a poor, worn-out condition.

LIME IN ALFALFA CULTURE.

Alfalfa is a curious plant. In some soils, such as one finds in Utah, Colorado, Montana and other semi-arid states, alfalfa is like a weed; it thrives with the least encouragement, spreads, persists, is immensely profitable. Then in the East there are a few regions where alfalfa seems almost native to the soil, such as parts of the glaciated soils of Ohio, Indiana, and Northern Illinois and Wisconsin. There are soils in New York, such as in Onondaga County, that grow it almost spontaneously. Seeing these facts, men urge that alfalfa will grow anywhere if it is sown and inoculated, etc. Then come experiments in other sections of the East and disastrous failure very often, and men wonder why. Often they have gone to much trouble to manure, fertilize, drain, inoculate, and even then alfalfa has not thriven. Now what's wrong? Here seems to be the secret. In the semi-arid West the soil is very fully charged with lime salts and other alkalies.

It is often too full of lime to make other cultivated crops thrive at all. Yet alfalfa there grows almost into a tree. In the glaciated regions of Ohio and westward there are millions of limestone pebbles in the soil, soft limestone pebbles, brought there by ice, centuries before you and I were born. These soils are alkaline. In Onondaga County, New York, the soil is full of pieces of soft limestone, and in parts of Kentucky where alfalfa grows well the soil is filled with shaley limestone fragments. So in Alabama and Mississippi where alfalfa seems almost native, the soil is made up of soft limestone rock, decayed by the weather into soil. It is very fully charged with lime.

Well, have we not all along taught that alfalfa needed lime? Maybe we have, but we have said "lime" in so mild a manner and so low a voice, that we have not been heard. And when men asked timidly, "How much lime?" we have replied, "Oh, whatever your soil needs," and let it go at that. The result has been that men have failed to become impressed with the very great, the really vital importance of having not "enough" but "too much" lime in the soil, for making alfalfa do its level best. The plain fact is that alfalfa loves lime, feeds on lime, eats and drinks lime, wants lime first, and whatever else it can get.

Give me well-drained soil, either by natural drainage or artificial, and access to a lime heap, and I will make Colorado or Arizona alfalfa in Rhode Island or Connecticut or New Jersey or Maryland. In truth, I have done it already in several of these states. Instance, one farm near Philadelphia. This farm had been well manured, was rich, was drained, yet would not grow alfalfa profitably. After investigation I prescribed lime. Man asked, "What kind of lime?" I replied "Ground limestone, unburned, if you can get it." He found he could get it cheaply enough, and came again. "How much lime?" "One hundred

To Stock Owners:

In order that our policy holders and those interested in live stock insurance may have a better knowledge of what we are doing, we issue the following list of losses paid. We would earnestly ask those contemplating insurance to write to any of the parties named herein relative to our promptness and fair dealing.

This is a home Company, organized under the Laws of the State of California, with a deposit with the State Treasurer as a guarantee for the payment of losses, and the only company where insurance can be obtained at actual cost to the policy holder.

We have written in the last six months over $1,100,000.00 insurance, and with the support of the farmers and stockmen of California we will make a stronger and much better company than any of the eastern companies which have proved of such value to the stock owners.

pounds to the square rod, that is little enough," I replied. The man hesitated at that and balked just a little; one hundred pounds to the square rod is eight tons to the acre. He put on six tons. He inoculated the soil with other soil from a good alfalfa field. He sowed alfalfa. He got six tons to the acre the next year. And all his neighbors came to see the miracle that had been worked. That lime cost the man about $12 per acre. His six tons of alfalfa hay were worth to him at least $100 to feed his cows, so it paid him immensely, did it not?

Again, many men who have grown alfalfa with fair success have been troubled with annual grasses and weeds. They have fought these in many ways, usually with partial suc-

A JERSEY BEAUTY.

cess. Now we have learned this. Where there is enough lime in the soil the alfalfa will subdue crab grass and almost any weed; will subdue all grasses except Kentucky blue grass, and that is easily taken out in the Spring with a spring-tooth harrow. My letters from the south this Summer are filled with cheering illustrations of how easily crab grass, their great bugaboo, is worsted in alfalfa fields simply by the use of large amounts of lime! That makes the alfalfa too lusty for the crab grass. Keep up the campaign for alfalfa and lime, lime again, and then shut your eyes and keep on liming; eight tons of ground or finely crushed limestone to the acre. Two tons of burned lime, three tons of air-slacked lime to the acre. Then phosphorus, manure, good seed.—Charles E. Wing, in Rural New-Yorker.

A HARBINGER OF GOOD TIMES.

The bright outlook for business conditions all over the country is not a new thing to the farmer. His prospects were brightened long ago by the invention of wonderful labor-saving and time-saving implements which have enabled him to increase his yield and market his output with corresponding increase of profits, despite depressed conditions in the industrial world. People must live, and to live they must eat. Whatever else they are compelled to do without, they cannot do without food, so that whatever adds to the efficiency of the farmer in his food-producing vocation, adds to his blessings. One of the most important factors in bringing about this condition was the invention of Planet Jr. Farm and Garden Implements. They have revolutionized the slow, laborious old gardening and farming methods and have put them in the class of twentieth-century achievements. As an instance, No. 4 Planet Jr. which is a combination hill and drill seeder, wheel hoe, cultivator, furrower and plow is the most complete tool a farmer or gardener can have on his place. He can do more work with it and keep things in better condition in one-sixth the time it would take without it. The No. 4. is only one of the many Planet Jr. implements—there is one for every farm and garden task, whether for hand or horse power—and all of them are sold with an iron-clad guarantee of absolute satisfaction.

S. L. Allen & Company, Box 1106 P, Philadelphia, Pa., who make these implements, have issued a handsome 56-page illustrated catalogue for 1909, which they are sending out to anyone interested in better farming methods and labor-saving devices.

Imperial Valley Lands have a greater earning capacity per acre than any land on earth. For price list and information address, James S. White Jr., and R. A. Holt, Holtville, Cal.

Bees and Their Care

THE DRONE BEE.

WITH the closing of the honey season comes the passing of the drone. The air is no longer filled with the loud hum of great strong wings, they have had their day; it may have been sweet, it certainly was short. They toil not, honey they have not gathered, neither have they helped build the beautiful white combs; yet one cannot justly speak of them as the lazy drones, says a writer who claims to have studied bees and their habits. They show as much if not more energy and vim, are just as industrious in fulfilling their mission as is the queen or worker bee. A drone bee can't gather honey any more than a rooster can lay eggs, because he is not made that way. They would starve in the midst of the sweetest clover field that ever bloomed.

In order that you may get a better understanding about these bees and the queen, let us go back to the early summer. At this time every normal colony raised from a few thousand to many times that amount of drones, all depending on the amount of drone comb in the hive. (Drone cells are one-fourth inch across while worker cells are only one-fifth inch across, and not so deep, and a drone cannot develop in a worker cell.)

As soon as these drones are old enough they go out of the hive in the middle hours of all fair or warm days and fly around in search, or at least are on the alert for any young queens that may have come out for the purpose of mating with them. It is here, in the open air, often not above the sight of man, that the mating takes place, the drone bee dying instantly. The queen then returns to her hive and in a day or two begins to lay, and will lay fertile eggs—often 3000 to 4000 a day—for from two to four years, without mating again.

We have slight evidence that some queens have mated more than once before beginning to lay, but we have only a vague suspicion that it ever occurs after a queen has commenced to lay.

This being the case, one is apt to wonder why a colony rears so many thousand drones when only one or two is absolutely necessary. But it is a wise provision of the Creator. If a colony had only one or two drones the young queens might be in the air all day and not meet one, especially if there was only the one colony in that location. As it is there are thousands, and near a large apiary there may be millions in the air, but as they fly many miles from home, covering a whole township, they are not much crowded after all. It also leaves little chance for close or in-and-in-breeding.

While honey is coming in freely the drones seem to be congenial associates, not only in the colony where they were hatched, but in any colony they may enter, and often join colonies that are miles away from their original home.

As the honey flow ceases the bees seem to know that they will have no more young queens and therefore no use for drones, and they are no longer welcome. Their own colony either drive or starve them out, and when they enter other hives they are stung to death the same as a strange or robber bee would be unless the colony is queenless or has a virgin queen, then they are welcome.

The drone has no father, he is merely the son of his mother. If a queen is not mated with the drone bee before she is two to three weeks old, she begins to lay and the eggs hatch out perfect drones, but never any worker bees. If a pure black queen mates with a yellow Italian drone, the worker bees from her eggs will be mixed, often all the way from black to yellow, but the drones will all be black and free from any trace of the yellow or Italian blood.

The drone's lot is not an enviable one; he starts with but one parent and if the honey flow stops before he is ready to hatch he is jerked out of his cradle and thrown out of the hive. He is wanted while useful and stung or starved to death whenever business is not booming.

NEW BEE-KEEPING TERRITORY.

If the Imperial valley will hold no more bee keepers until Harriman waters that small matter of 1,500,000 acres we must look around for other fields to conquer. There is some room at Yuma, on the government reclamation project, which will soon be ready. Then there is the Great Salt River Valley project; but probably this will be fairly well occupied by bee keepers now on the spot. There will be 300,000 acres of irrigated land at Parker, Arizona, where some one is building a great bridge over the Colorado River. There is a considerable body of irrigated land at Needles, on the Colorado, and more will be reclaimed. There are 40,0) acres available at Palo Verde, on the California side of the Colorado. The U. S. Reclamation Service has in mind an immense project on the Colorado, embracing Utah, Arizona, and California, which will cost in the neighborhood of $40,000,000. That's some money to spend on a dam. This would completely dwarf the great Assouan dam on the Nile, and make a great paradise for bee keepers, as alfalfa, dates, and oranges would be the leading crops. The date is a fine honey-yielder, excelling alfalfa, in my opinion, and, of course, the blossoms are not cut.

New Mexico, too, is forging ahead, and ere long will cut a figure as one o. the important honey states. When the immense Elephant Butte dam is completed a great stretch of land will become available for bee keepers. Around Deming pumping plants are doing wonders in bringing lost rivers to the surface, and probably large areas elsewhere can be reclaimed. Southern Utah (Utah's Dixie) holds much in store for bee keepers. Even oranges will grow, and the date is hardier than the orange. Southern Nevada, too, is making headway, and for fruit culture they claim to have California "licked," whatever that may mean. Oranges grow there also, but figs are in their glory and so are grapes.

Date culture will help bee keeping, and I opine Texas will stand an excellent chance in this respect. Florida might cut quite a figure in date growing, and probably the Sea Islands of Georgia and South Carolina. Dates do well in Bermuda and the West Indies, and it is amusing to see the bees at work on the blossoms. They simply crawl over the blossom as they do on a feeder until they fill up.—Gleanings in Bee Culture.

Made of wire that is all life and strength — wire that stretches true and tight and yields just enough under impact to give back every jolt and jam it receives.

Made of materials selected and tested in all the stages from our own mines, through our own blast furnaces and rolling and wire mills, to the finished product. Our employment of specially adapted metals is of great importance in fence wire; a wire that must be hard yet not brittle; stiff and springy yet flexible enough for splicing—best and most durable fence material on earth.

To obtain these and in addition apply a quality of galvanizing that will effectually protect against weather conditions, is a triumph of the wiremaker's art.

These are combined in the American and Ellwood fences—the product of the greatest mines, steel producing plants and wire mills in the world. And with these good facilities and the old and skilled employes back of them, we maintain the highest standard of excellence possible for human skill and ingenuity to produce.

Dealers everywhere, carrying styles adapted to every purpose. See them.

General Agriculture

WHAT IS DRY FARMING?

For the information of those who are not familiar with the work that is being done in the West by the Trans-Missouri Dry Farming Congress, which will hold its third annual sessions at Cheyenne, Feb. 23, 24 and 25, William C. Deming, editor of The Wyoming Tribune, and who will be present and is expected to address the congress, has answered the question, "What is dry farming?" in the following words:

"Two years ago in the Rocky Mountain West dry farming was a joke and a by-word. Today hundreds of thousands of acres are, or soon will be, under cultivation by this method; thousands of sturdy men are its devotees. Dry farming has joined hands with irrigation in reclaiming the barren wastes of the West.

"Technically speaking, all that section of country in which the annual rainfall is less than twelve inches is called arid. Where the rainfall exceeds twelve inches and is less than twenty inches, it is called semi-arid. For convenience and easy reckoning, draw a line from Bismarck, North Dakota, through North Platte, Nebraska, to Laredo, Texas, and all that country to the westward to the Sierra Nevadas and the Cascade Mountains may be termed arid or semi-arid, and it embraces more than one-third of the entire United States. In this section is all that is left of the public domain, and it is the hope of the men and women who, crowded out of the congested East, desire to carve out new homes in the West and transmit to their children a family rooftree.

Only a Tenth By Irrigation.

"It should be remembered that the most liberal estimate ever placed upon the amount of arid and semi-arid land which it is possible to reclaim by irrigation, if all the waste waters were utilized, is ten per cent of the total area, and this doubtless is twice too much.

"After counting out the irrigated land and mountainous lands, the worthless lands, the timbered lands, the mineral lands, the government reserves and all other lands suitable for grazing purposes only, we may have left twenty per cent of the whole section reclaimable by dry farming.

"The arid and the semi-arid West for forty years or more has been largely a sheep and cattle pasture, and it is conservatively estimated that it requires from twenty to one hundred acres to support one animal, the average being about thirty-five.

"It will be readily seen, therefore, that if after all the available water has been used for irrigation, there is still an agency by which other millions of acres may be reclaimed, then cosy homes will replace the sheep wagon and school children will romp where only lambs flocked before.

"What, then, is dry farming? In plain words, it is farming successfully with the natural precipitation, which must be so conserved and used as to obtain results. The world has plodded along for several thousand years, and yet it has occurred to but few people, until within a decade, that it is possible to store up the moisture as it falls and use it when desired. When rains come and the snow melts upon the native sod in the arid and semi-arid West, the moisture is either quickly evaporated from the surface or passes into the ground, from which it is almost as quickly drawn by the same process of evaporation.

"When the land is plowed and permitted to lie without subsequent tillage, the moisture, whether from rain or melting snows, soaks into the ground, possibly to the depth of the furrow, from which it is again withdrawn by evaporation. Influenced by the heat of the sun and the aridity of the atmosphere, the surface bakes and a crust is formed. The untutored and uninitiated, as it were, in the dry farming cult, would no doubt, assume that the crust so formed would act as a protection against the 'drawing' influence of the air and sunshine, and would, therefore, prevent evaporation. The reverse is true, and herein is the key that unlocks the secrets of dry farming. The crust so formed is cellular. It is full of little holes, through which practically all of the moisture beneath passes out into the air.

Conservation of Moisture.

In the arid and semi-arid West, particularly in the rarer atmosphere of the higher altitudes, the evaporation takes place so rapidly that the residents of those region almost invariably under-estimate the annual rainfall. The average altitude of the arid and semi-arid region is about one mile above sea-level.

"Since dry farming has been reduced to a science it will not be amiss to use scientific terms where they elucidate rather than obscure the subject. The process of evaporation through the cellular crust above referred to is the result of a force known as capillarity. A familiar and effective example of capillary attraction is that of holding the edge of a lump of sugar in water and watching the moisture move steadily toward the top. Or a better example still, in which capillarity and evaporation are both illustrated, is found in the lamp, the flame of which consumes the oil as fast as it rises in the wick, through capillarity, just as the warm dry air consumes all the moisture in the ground by means of the cellular 'earth-wick.'

"It must be evident then that if provision is made by which the precipitation, which readily passes into the soil, is prevented from passing out by capillary attraction and evaporation, we are in a position to use this moisture and produce a variety of crop; it having been demonstrated conclusively that agriculture can be carried on successfully and profitably with a minimum of twelve inches of precipitation, if all is devoted to the right use.

Fallow.

"As a rule, it is better to let a piece of ground, whether fall or spring plowing, lie fallow during the summer, seeding it each alternate year. During the fallow season the surface of the plowed ground should be harrowed or stirred after each heavy rain, or big snow, thus forming a dust mulch or blanket, as it were, by which capillary attraction is destroyed and evaporation reduced to a minimum. Even the casual or indifferent student of agriculture will see that the effect of harrowing after rain or snow prevents the forming of a crust and the

consequent cells which accelerate evaporation.

"Thus the secret of dry farming is the conservation of the moisture that falls and the secret of the conservation is the destruction of the little cells at the surface through which evaporation is so active and the secret of the destruction of the little cells is frequent harrowing of the surface, which prevents the forming of the crust.

"The soft dirt or granular condition permits the moisture to pass rapidly into the ground and likewise holds it where it will do the most good. That, in brief, is the science of dry farming, which after all is not "dry" farming, but the intelligent retention and application of all the moisture that falls in a section of country whose agricultural possibilities have heretofore been considered more than doubtful."

PLANTING ALFALFA ON SALTY LAND.

In an address on the above topic, Mr. E. Brauckman of Mecca at the recent Farmers Institute at Thermal, said:

"It is with some diffidence that I appear before this institute in the capacity of instructor in matters relating to agriculture. I feel that there are many old farmers in this meeting at whose feet I might sit and learn. It cannot be said that my brother and I went at it haphazard in planting our alfalfa, for we gave it serious consideration. Not being farmers, having been born and reared in a large city, we were indeed tenderfeet in our knowledge of the science of agriculture. As is usual, there are many ways of doing a thing, and in our questioning of alfalfa growers we received various and sundry pieces of advice as to the best plan to succeed. Nurse crops, etc., were discussed. Where we have an abundance of water, as we have around Mecca, the planting of a nurse crop is superfluous. In seeking for information, the feasibility of raising alfalfa on such salty land as ours was doubted, for no one had tried it. A certain doctor, agent of the Agricultural Department at Washington, in inspecting our ranch, was filled with astonishment at what he saw. He exclaimed: "I have seen alfalfa grown on all sorts of alkali land, but on nothing like this. How did you do it? How did you do it?"

The piece of land we selected for our alfalfa was cut up by a wide wash, down which the waters from the north flowed in times of excessive rains, an event which happened but once in the six years that we have lived on the ranch. The former owner of this particular piece of land after we had bought the place, was so pleased with his bargain that he told the neighbors that he did not see what we wanted with the ranch, as you could not raise anything on it. However, we had faith that we could make it go.

In leveling the land, with a Fresno scraper, we hauled hundreds of loads into the wash, yet as the upper part contains the most salt, the seed germinated there as well as it did at the upper and lower ends. Our land at that time was much drier than now. No doubt the Salton sea has sucked up the water, and there is considerable seepage from above from irrigation waters. So it was that the surface of the ground was nothing but dust. Into this dust we sowed eight pounds of seed to the acre with a hand seeder. After the seed was sown, a horse was hitched to a mesquite branch and dragged over the surface to cover the seed, after which water was run over it. In three or four days we were gladdened to see the ground covered with young plants, as someone expressed it, as thick as the hair on a dog's back.

If memory serves me right, the mature alfalfa plant can endure seven times as much salt as the young plant, from which it is plain that the young plant must be irrigated frequently to dilute the salts that will gather around the young rootlets and eat them. From my observation it seems plain to me that the growing of alfalfa on salt lands can only be accomplished by the use of an abundance of water. However, care must be taken that the lands are perfectly even so that the water will not stand any length of time, or the young plants will be drowned out.

Four bills have been introduced in the State Assembly providing for an appropriation for the State Agricultural Society of $30,000 for new machinery hall on the fair grounds, $20,000 for an agricultural pavilion and manufacturers' building, and third for $10,000 for work on the ground and $10,000 for tanks and pumping machinery.

LARGEST VEHICLE FACTORY IN THE WORLD

Small Fruits and Vegetables

GROWING CAULIFLOWER.

THE secret of a good cauliflower—one that combines tenderness and delicacy of flavor—is continuous rapid growth, which can only occur where the soil is sufficiently deep to hold a proper supply of moisture. The ideal cauliflower is one that has a properly blanched "curd" of snowy whiteness, ever uniform texture and the absence of small green leaves sprouting between the sections comprising the head. This last condition has been attained by the careful selection of the best heads for seed purposes, and there are great differences in the various strains that are offered in the trade. The highest type is necessarily expensive, and if you would have the best cauliflower you must buy the best seed.

The critical time for cutting the head is when it has reached its full size, but before the curd shows any separation, which indicates the starting of the flower shoots. Heads that remain on the plant after this time show a sort of granulated appearance and a slight discoloration. The idea that any poor sort of head is suitable for pickling is misleading. One that is not good enough for the table is not good enough to pickle, although the better portions of damaged heads may, of course, be used. A discolored tough or inferior head will make a dark colored, poor pickle.

Varieties or strains of cauliflower have been divided by selection into two types, the early and the late. The seed of the first or dwarf type is produced in cold, northern sections—the farther north, the earlier and dwarfer is the strain. Seed of this is the most expensive because the crop is produced under practically garden conditions. Seed of the later, larger kinds is produced in a warmer climate and is comparatively cheap. But the late varieties take a long season for growth, they occupy as much space as the largest cabbages and there is some uncertainty as to their ever heading. The home gardener should plant the extra early dwarf sorts.—Journal of Agriculture.

MAKING A SMALL GARDEN.

The soil must be well drained clay loam, filled with humus by plowing in animal manure, or green crops. Generally it is better to plow or thoroughly work a liberal quantity of manure into the soil before planting, then supplement with composts and chemical fertilizers as needed. The better way is to use new clover sod for the garden every two or three years. If this is not done, it will need frequent applications of wood ashes or lime to prevent acidity of the soil. When the stalk or leaf is the edible part, feed the plant well with nitrogen, which is generally most available in vegetable or animal manure; when the fruit, bulb, kernel or root is used, feed well with wood ashes, potash and phosphoric acid in some form.

Plan.

The garden should be rectangular in form, at least twice as long as wide, and should, if possible, slope to the south or east. The bush fruits and vegetables not removed annually should be located all on one side of the garden or on a separate plat. Everything should be lined in perfectly straight rows, to facilitate cultivation.

Planting.

In planting seeds a good rule is to work the soil only when it is dry enough to crumble in the hand, to cover the seed to a depth of two or three times its thickness, and firm the soil over it with the feet or other means. Use the seed drill where practicable. Sometimes a light mulch placed over the surface for a short time and kept moist causes quicker germination. Plant varieties known to grow well in your own or similar localities, and experiment with novelties only in a small way. Plant seeds purchased direct from a reliable seedsman.

Cultivation and Tools.

Having the garden planned in long, straight rows, we are able to use the hand wheel and horse cultivators, and greatly reduce the labor of cultivation. Different forms of hand hoes and weeders are needed to work in the spaces between rows not reached with the wheel cultivators. Try to cultivate before the weeds appear, and keep an earth mulch an inch or so deep in the uncultivated spaces, to conserve moisture. Keep the surface level. Make no "hills" or "beds" for any crop.

CABBAGE WORMS.

Nearly every one who grows cabbage is troubled more or less with these pests and we are glad to note every remedy which has been tried by gardeners. We give two herewith which can be recommended to do what is claimed for them. Take a pint of barrel salt and dissolve it in a gallon of water. After the salt is thoroughly dissolved sprinkle it on the cabbage with a common garden sprinkler. The result is no worm-eaten cabbage.

Take alum and dissolve it in water and apply it to the cabbage with a common sprinkler as often as there are any worms to be seen. A few applications are sufficient. This remedy is entirely harmless, not very expensive and is sure destruction to the worms. Make the solution quite strong with alum.

SPUD POINTERS.

Potatoes planted three inches deep matured earlier and produced a larger crop than those planted four and a half and six inches deep.

Level culture proved more profitable than bedding and "hilling up" the rows.

In a complete fertilizer, potash over 6 per cent was unprofitable, while usually large percentages (8 per cent and 10 per cent) of phosphoric acid greatly increased the yield.

Cottonseed meal applied only a few days before planting was too slowly available to prove a desirable fertilizer for early potatoes.

Some one has said that tillage is fertilization. This may not be literally true, but it is true that with intelligent and thorough tillage thin land will nearly always produce better crops than richer land with insufficient tillage.

The Ornamental Garden

POINTS ON BEAUTIFYING HOME GROUNDS.

THE following hints on beautifying home grounds are written by J. E. Mundell of the New Mexico College of Agriculture.

Site.

The trees and plants surrounding the house are analogous to the frame of a picture and should be so arranged as to give a good background to the buildings and help to present a natural view of the place.

Soil.

The soil in which the trees are to be planted is a very important consideration. If the soil is too sandy and gravelly so as to be deficient in plant food, good success with trees will be hindered unles the soil be well fertilized. On the other hand, the soil may be too heavy; but this condition can be overcome, somewhat, by the proper application of stable manures.

A good loamy soil is conceded to be the best for trees and ornamentals, and in some cases it would pay to haul this kind of soil to start the trees in.

Selecting the Trees and Plants.

Before selecting your trees, take a drive through the neighborhod to see what trees and plants are already growing with success in the yards of your neighbors. Then go to your nursery catalogue and order your trees and plants with a feeling of assurance that they will grow if you give them the proper care and attention.

Size of Trees to Order.

In ordering trees do not select those that are too large, because it has been found that the best success has been secured with smaller trees especially with conifers.

Time to Transplant.

All plants, to insure the best success, should be transplanted during the dormant season, and while they can be set out in the fall or winter, spring planting is preferable.

Transplanting.

In transplanting do not place the trees too close together or where they will obstruct the front view of the house. Plant the shrubs and ornamentals in front of the trees, also near the house to soften the outlines, and in the sharp angles made by the walks or beds. To prevent shading of shrubs and ornamentals they should not be planted too close to the trees. When flowers are planted they should be placed in front of the shrubs to finish the background. It is not a good plan to cut up the lawn in front of the house by trees or shrubs; a few small groups of shrubs planted in the proper places will break the monotonous outlines of the lawn.

Care and Management.

After planting the plants, they should receive good care and attention. Plenty of water must be supplied to them either naturally or artificially. The soil should never be allowed to become dry. The time to irrigate can be determined by examining the soil. If the soil around the plants cracks open too much after irrigating, the cracks should be closed by filling with soil or tamping it down. This should be done until the trees or plants are established.

Pruning the trees and shrubs should be practiced only when necessary. Plants should be pruned to give them form, to remove extra growth and dead branches. The natural form of the trees, shrubs, and ornamentals should be preserved as much as possible. Limbs removed should be cut off close to the trunk to insure quick healing of the wound.

HOW TO MAKE HYDRANGEAS BLUE.

IT IS a little late for this year, but it is good to remember. The monthly circular of the Women's Agricultural and Horticultural Union gives the following about hydrangeas:

As present there is a craze for the blue-tinted flowers; and for commercial purposes these are artificially colored, since there is no variety which can be depended on for blue flowers, which is also suitable for market use. Plants growing in the open ground will occasionally produce blue flowers, and revert to pink the following year. Iron in the soil tends to give the blue tinge, so iron-filings are sometimes mixed with the potting soil for this purpose, though water containing a solution of alum is more generally used. In one district of France, where the blue tint appears without extraneous aid, the properties of the soil are found to be silicious, with rich humus, phosphates and iron. Lime is almost absent, so should be avoided in the culture of hydrangeas, if the blue is aimed at. It is said also that where blue flowers occur naturally it is on plants that bloom late, when the wood is well ripened.

Some sandy soils, and others where fragments of slate predominate, have the effect of turning pink hydrangeas to blue. These are not available everywhere, so we must seek a good receipt for bringing about the transformation.

The following, which appeared some few years ago in the Revue Horticole, can be depended upon. This, in agreement with what has already been noted as to ripened wood, lays down the law that to experiment on young cuttings is useless; plants must be at least two years old, and healthy before being taken in hand. Turn them out of the old pots and wash the roots perfectly clean; then pot up in either of the composts:

(1) Sandy peat with 10 per cent iron-slag, 3 per cent sulphate of iron and 5 per cent dried and crushed animal manure.

(2) Sandy peat with 10 per cent powdered slate, 3 per cent sulphate of iron and 1 per cent ammonia.

In either case the plants are to be watered twice a week with water in which 36 grains to the gallon of sulphate of iron has been dissolved. It will be seen that the comparatively high price of blue hydrangeas is to be accounted for in two ways; first, that they will be three seasons old before fit for sale; secondly, that the process is somewhat tiresome, and involves the stocking of ingredients not usually required in the potting-shed.

This all applies directly to the English pot culture. In California a single plant grows as large as a small greenhouse in the open ground. The coloring prescription will, however, work under our superior conditions and produce a deeper blue than we now get from the iron which is naturally abundant in most California soils.—San Jose Mercury.

DOUBLES YOUR CROP

"No tree too high, no field too big for this king of sprayers." For orchards, vineyards, potatoes, weeds, etc. No hand pumping required—works automatically. One man can do more work with this machine than two men with the old style sprayers. Saves labor, time and money.

ORGANIZE.

I ENJOYED a very interesting call from some ladies from La Habra recently, and one of them seems to have such good luck with her chickens that I must tell you about her.

They have large runs, and separate into 25 hens in a lot, and keep corn in the ear and dry mash before them all the time, and from 200 hens were getting $80 worth of eggs a month, while the feed cost on an average $5 a week. They have about 40 acres of land, but find the hens do better penned up in small flocks than at large, and their coops are of the simplest description. They are made mush-room fashion, of shakes, doubled over so as to leave no cracks, and are set up on legs so the wind blows freely under the birds. They are moved often, and sprayed inside, which can be easily done, as the coops can be tipped over sideways. They believe this method has many advantages over the house that is built to stand in one place, and as they have no sick birds their method is surely successful.

Some difficulty was experienced in marketing the eggs to good advantage, and their visit was partly to discuss some better way of reaching the consumer. But as time was too valuable for them to market directly to customers they sold to grocers. Could these people supply some hotel regularly, I mean could some hotel be found that would take these eggs regularly, these people would be very glad to furnish them, but so far, they have not found such a customer, and the plan suggested at the Poultry Meeting, that of organization on the part of the producers, and united effort to get at the consumer in the cheapest and most convenient way, is the slogan of egg farmers at present.

THE CHICKENS' KETTLE.

Until one keeps a kettle on the back of the range into which every little eatable scrap is thrown, one never knows how much good chicken feed goes to waste even in a small family.

There are potato peelings, scraps of meat and gravy, bits from the table, little dabs of sour milk, canned fruit, etc., and even the settlings from the dishwater make up a foundation for a mash that is highly relished by the biddies. And of course, whatever is relished. helps out the egg basket, so this form of economy certainly pays.

All eggshells should be carefully dried, and crushed to feed the hens, and when mixed in the kettle with other things will not teach egg eating.

Cold pancakes, and old biscuit which cannot well be used in any other way soak up nicely here. In fact there are so many scraps after the habit of saving them has once been fixed, that one wonders how one ever got along without it. Then if placed on the back of the range it is warm by the time breakfast is ready, and the biddies like that these damp cool mornings.

I use a plenty of black pepper in the mash these mornings, and so far have not had a sick bird on the place.

Chickens must have a little salt occasionally, or they will go to eating each others' feathers, so season the mash sometimes with salt.

I don't have material for a mash every day, even with saving every thing, but about twice a week I do.

Talk about saving, did you ever hear of the old lady who wouldn't allow guests to rock, "because it wore out the carpet so?" I was well acquainted with her but don't think our kettle quite so "near" as that.

One has some funnny experiences sometimes. A man once wished to get some late hatched R. I. Red pullets of me. I asked a very low price for them, and he asked me to catch them so he could look them over a little closer—R. I. Reds being very new and scarce at that time.

He looked them over, after I had chased around in the snow an hour to catch them, then offered me some "nice Plymouth Rock cockerels for them pound for pound" and seemed quite hurt because I couldn't deal that way. Frank never got through guying me about that "sale."—Mrs. Frank Metcalf.

PRESERVING EGGS.

Probably the water glass method of preserving eggs is preferred since its effectiveness has been so fully proven. It is however slightly more expensive than the other methods, especially where one is some distance from the market where water glass, sodium silicate, may be secured. For the benefit of all we give the following four methods of preservation.

Eggs to be stored should come from hens that have no males running with them; should be perfectly fresh and clean, for filth of any kind adhering to the egg will prove the medium through which the other eggs will become tainted. A dry, moderately cool cellar is the best place to store them.

Water Glass.

Take ten quarts of water which has been previously boiled and add to it one pint, or some prefer it stronger, even a quart, of water glass. When fresh eggs were used however and put up in June they were in excellent condition the following March with the weaker solution. Water glass varies in strength, and one must be guided by the thickness of it. If very heavy like thick honey less is required. Mix while the water is hot. This may be placed in a jar or tub and the fresh eggs added from time to time, always being careful to have at least two inches of the solution over the eggs.

Lime Water.

Another good preservative may be made as follows: 3 gallons of water, 1 pound of salt and 1½ pints of finely slaked lime. Mix thoroughly and allow the solution to stand a day or two and then remove the clean liquid by dipping or by means of a siphon. The clear liquid is then put into the vessel in which the eggs are to be kept and the eggs added from time to time.

Bran or Salt.

Either one of these methods is reliable, but it must always be remembered to have at least two inches of either the salt or bran above the top layer of eggs.

Cold Storage.

This is doubtless the best method of all where it is possible, but owing to the limited number of storage plants it will be necessary to resort in many cases to one of the previously mentioned methods.

FOOD FOR LAYING HENS.

The hen requires more kinds of food than a cow or a hog. The cow needs no animal food; the hen does. The hen gives more consideration to cleanliness of the product than the cow; she seals it up in a shell of lime to keep it clean and she therefore must have a liberal supply of mineral matter. All food furnishes a certain amount of mineral matter, but not enough to supply all the shell material when hens are laying heavily.

What foods should they be fed? They should have grain; but grain alone won't do. What will happen if the hen eats nothing but wheat? Remembering that she puts nothing into an egg that she does not eat, that an egg contains about one-fifth ounce of fat and that if she ate nothing but wheat she would get enough fat for three or four eggs a day and about enough protein for half an egg a day, the thing that will happen will be that she will refuse to make eggs. The hen does not adulterate her product, otherwise she could fill up the egg with surplus fat like some people make butter out of spurious oil or beef fat. She will make an honest article or none at all. The point is that the hen should have such foods as will furnish the necessary food elements in proper proportions; in other words, she should have a balanced ration. There are different ways of balancing the ration. For instance, if the hen has access to wheat, to clover or kale and to grasshoppers, angleworms and grit, she will balance her own ration. She will eat a little wheat, a little clover and a few grasshoppers or angleworms, and eat enough of each to furnish the egg-making elements in right proportion. An occasional feed of corn or oats in place of wheat would improve the ration.

A hen is said to have the capacity of laying 600 eggs and no more—a few in her first year; from 320 to 375 in the next three, and the rest from the fifth to the ninth inclusive.

PETALUMA CHALLENGE CUP.

In the account of winnings of the Petaluma Poultry Show the Cultivator recently made the winner of the $50.00 challenge cup as Lippit & Lippit. As a matter of fact the cup was offered by Lippit & Lippit of Petaluma and was won by Mr. Frank E. Baldwin, the White Leghorn specialist of San Jose.

PIGEONS FOR PROFIT.

In starting a loft of squab breeders it is well to settle the birds all at one time, so they will quickly get down to breeding operations.

A young hen that is not full grown can not be expected to raise large squabs; and, even if she does, a few nests will prove such a strain upon her that the possibility is she will collapse, or probably next year become a non-layer.

There is no truth in the theory that

Coulson's Special Dry Chick Food

Makes Them Grow

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

different colored birds mated together will give better stamina. The same theory was used some years ago in favor of the dunghill fowl.

When the birds are off their feed and sit about huddled up, with their feathers loosened, they will probably be found a have a prominent breast bone, and to be suffering from indigestion.

Squabs can be profitably raised on any farm located near a market.

When entering the loft, always walk slowly and make no quick movements.

When pigeons have their liberty they gather considerable weed seeds. In the crop of one bird killed at nightfall were found nearly 4,000 weed seeds, and the crop was only partly filled.

Pigeon-pox is caused by protozoa, and is more apt to appear in damp quarters and during wet, foggy weather. Protozoa, or fungi, multiply rapidly where there is moisture, while bacteria increase faster in heat.

The difference between chicken and pigeon-pox is that in the former the ailment is generally confined to the chicken's head, while on pigeons the disease will travel from the head down the neck, over the under surface of the body, and on the inner side of the wings and legs.

The fact that the squab business can be conducted in a very limited space, and that the breeder of squabs can conduct his little business without interfering with his regular work, makes squab raising one of the little side industries which may be made to amount to a princely sum in the course of a year.

When you pluck squabs that are too old, and dress them, and plunge them into cold water to plump them, their skin is not smooth and pleasing to look at, but has the appearance of goose flesh and shows where the feathers were pulled out due to the fat, which is the valuable part of the squab, having been absorbed into its system as soon as it commenced to exercise.—Orffs.

TURKEYS, DUCKS, GEESE.

Remember the breeding toms are half the flock in the spring and keep the best for that purpose.

When buying new stock to improve the flock, be sure that it is from a hardy family and not from an ancestry afflicted with disease.

Although corn is a fattening food and breeding turkeys should not be very fat, a fair amount of that grain should be fed to supply heating elements to the body.

Charcoal is as good for turkeys as it is for hens and a supply of it where the turkeys can get at it at all times will do much to prevent stomach and bowel troubles.

Never allow the turkeys to roost in the chicken house or to eat with the hens. They must be kept separate or good results cannot be obtained from either turkeys or fowls.

Geese should have principally dry grains of which corn, wheat and oats should form the greater part during the winter time.

Although small ducks should not be bred from, the extremely large ones do not prove as prolific as those which are simply rather above medium size for the breed.

Four ducks to each drake in the cold months and five and six in the warmer months is the proper proportion and twenty-five or thirty may be penned together with satisfactory results.

Toulouse, Embden and White Chinese are the most popular geese among America's poultry keepers. The other varieties are good, however, and all geese are profitable if properly handled.

If early ducks are to be most profitable, the first eggs must be set in February, and that means that the breeders should now be mated up and the food should contain more beef scraps.

A good mash for breeding ducks is two parts bran, one part corn meal, one part cooked mashed vegetables or steamed green cured clover and about ten per cent of high grade beef scraps by bulk, the whole mixed together dry and moistened with milk, skim milk or water.

WHITE CHINAS.

China geese are the most prolific of layers and the feathers are much softer and finer than those of any other breed; are as soft as any duck feathers and yield an abundance of them. White China geese are very gentle and can easily be made as great pets as a cat or dog; are splendid watchers in the poultry yards, the slightest unusual noise is soon told abroad by their noise, which by its tone will enable one to know whether anything is wrong or not. I have imagined that the White China geese were the ones that saved Rome.

They often commence laying in November and continue right along until June. I have been raising them five years, and shall always have a flock of them as long as possible. Aside from their value from a practical financial side they are very beautiful and graceful, called by many not only the Leghorn of the goose family, but White Swan geese. They are admired by everyone; many in passing stop just to admire and ask about them. They are very attractive, and admired not only at home, but in the show room.

The best poultry food is that which sends the hens to their nests every day.

The feed is important, but it isn't all. The hen house needs constant care.

Board floors are better than wet ground but dry ground is best of all.

The best poultry men on most farms are women.

One well fed hen is better than two half starved ones.

POULTRY QUERIES.

Hatching Turkeys.

When do you think is the best time to hatch turkeys?—W., Chino.

The best time to hatch turkeys is as soon as the rains are mostly over, and before the weather becomes hot and dry. Green growing things are necessary for the young poults, therefore the spring months are considered best. Much depends upon the use to be made of them, however, for if breeders are wanted, the earlier one can get them out of the shell the better, while if only for market purposes, they may be hatched at late as one pleases.

Here turkeys may be raised the year around, but the extra care needed during the rainy season scarcely justifies one in attempting to crowd them too soon. Unless, as I said before, breeders are wanted, or show birds to be raised.

Some of the best turkey raisers feed very lightly for a while after February on purpose to retard the laying, so as not to have the poults before the first of June, then later feed heavily to keep up the laying as long as possible, but a hen that has laid late in the fall, will be much exhausted and will be long getting in shape again. For the late poults shade must be provided, or sun-sickness will result. So April and May turkeys should be the best of the year, for market purposes.—F. M.

BROWN EGG AND WHITE.

It is a curious fallacy that the brown colored egg is necessarily superior to the ordinary white egg, a belief which has led to the practice of artificially coloring the latter in imitation of the former. It is doubtful whether the color of the shell bears any relationship to the nourishing quality of the egg. As those who rear poultry know, it is merely an indication of the strain of the laying bird. Still, a preference is very commonly shown for the brown or coffee-colored egg; the color is attractive, and, led by the eye, the choice is very generally made in favor of what is regarded as the richer and superior article. The practice of deception is thus encouraged. The shell of the white egg is stained in the simplest possible way, perhaps by immersion in a decoction of coffee berries or by means of an aniline dye. This resource may satisfy the eye, but, after all, there is probably not the slightest difference from the nutritive point of view between the naturally brown colored egg and the white one.

There is most probably, however, an important dietetic difference between two eggs, the yolk of one of which is very pale yellow in color and that of the other a rich, almost reddish color. It is a notorious fact that the country-produced egg may usually be placed under the latter description, while the egg produced by the hen who is under an unhealthy and limited environment shows an anaemic color, generally a very pale yellow. The eggs of wild birds, as for example, the plover, show a yolk of rich reddish color.

The substance which contributes color to the yolk of the egg is iron, just as it is iron which gives color to the blood, and there seems to be little doubt that the iron compound in the yolk of the egg is of similar nature to that of the blood. It is easily assimilated and eggs are regarded as a suitable food for the anaemic person, as they present a concentrated and generally easily digested form of nutriment rich in iron. The iron compound of the egg has, in fact, been termed a "hamatogen," because it is probable that from it the blood of the chick is derived. The amount of iron in the yolk of an egg would appear to increase with the intensity of the color, and there can be little doubt that the maximum is reached in the richly colored yolk of the egg produced by a fowl existing in healthy surroundings, for then its processes of nutrition would be working under very favorable conditions. As an article of diet, therefore, the egg should be judged, not by the color of its shell, but of the yolk, which should be of a rich reddish rather than of a pale yellow color.—Orff's.

FOR "CROPBOUND."

"Cropbound" in turkeys is universally caused by eating too freely of dried grasses, thus forming a hard ball in the crop. Pull out a few feathers near center of crop on line with breast bone. With a very sharp knife make incision one inch long of outer skin. Push this lightly aside. Make incision three-quarters of an inch long. Remove contents with finger. Be careful to see that every particle is removed from passage way to gizard. Take three or four stitches in the crop, make each one separate, same in outer skin. Use fine white cotton thread. Place bird in dry coop; feed lightly on soft food for at least a week or ten days. After turning out provide plenty of good grit. This treatment may seem a little severe, but it is the only way to save the birds.—Successful Farming.

Have you a dirt floor in the hen house? Then shovel out about two inches of it next fall and put in fresh earth. The old dirt is worth a lot on the garden, and it's too full of vermin to be healthful in the hen house.

"Chicks well hatched are half raised"
San Jose Hatchery, San Jose, Cal.
ANNOUNCEMENT

We stand for strong, healthy chicks and will spare no efforts to secure them. Our aim is quality rather than quantity. From the eggs we hatch we want the best chicks that can be secured. We shall limit our capacity to 12,000 eggs—six of our 2,000 egg incubators.

Three factors in securing chicks are—the breeding stock for hatching eggs; the incubator and the man to do the work.

We take great care in selecting our breeders from which we secure eggs. The stock must come up to our standard. Our Mr. Langenschwadt attends to this. He is a practical poultryman.

The incubator we use has been tried out and demonstrated for several years past what it can do. We consider it the best we have come across so far. The success poultrymen are having with chicks it hatches is proof sufficient.

In Mr. Henry Langenschwadt, our manager who attends the incubators, we have a man whom we are satisfied understands his business and he is demonstrating this by results.

At present can furnish following breeds and shall add to them as we can secure stock. All from utility stock:

White Leghorns we hatch regularly in two grades—No. 1 and special. Will hatch lower priced to order but cannot recommend them.

No. 1. White Leghorns: $9.00 per 100; $25.00 for 300; $40.00 for 500; $75.00 for 1,000.

Special White Leghorns: $12.00 per 100; $34.00 for 300; $55.00 for 500; $105.00 for 1,000.

Brown Leghorns, $10.00 per 100. Black Minorcas $12.50 per 100.
Rhode Island Reds, $12.50 and 15.00 per 100.

Lots of 50 add one cent each. Less than 50 chicks do not recommend to ship.

Address orders to SAN JOSE HATCHERY,
395 East St. James Street,

Irrigation and Forestry

UNDERGROUND WATERS OF SOUTHERN CALIFORNIA.

IN THE intensively cultivated horticultural districts which have made Southern California world famous, ground-water development for purposes of irrigation has been increasing in importance for a decade or more. Many of the largest irrigating systems, which a few years ago obtained their water wholly from mountain canyons, now depend on their subsidiary pumping plants to keep up the supply during summer and fall, and in a number of places pumped or artesian waters are the sole dependence of thriving communitites. So extensive has been this development that a conservative estimate indicates the proportion of underground water to surface water now used during the late summer period after dry winters, when the surface supply is lowest and the pumps are busiest, as three or four to one.

Reports Published by Geological Survey.

In the summer of 1903 W. C. Mendenhall, of the United States Geological Survey, began field work on a series of studies of the conditions under which the ground waters of Southern California occur, as a result of which five reports have already been prepared. The earliest issued were three (Water-Supply Papers Nos. 137, 138 and 139) relating to the coastal plain, which lies between the Coast Range and the Pacific Ocean. These papers did not embody close geologic determinations, but were rather records of the developments of underground waters which had taken place at the time of their issue. A fourth paper (No. 142) on the San Bernardino Basin, was more complete and critical and contained such significant geologic and economic information as had been brought out in the course of a rather careful general study of the valley. The fifth of the series has just been issued as Water-Supply Paper No. 219.

A Report on the Foothill Belt.

This latest report presents evidence and conclusions which will be of value to water users in the important region that lies along the south base of the San Gabriel Mountains from Cucamonga westward to Los Angeles. The belt embraces a small area in the extreme western part of San Bernardino county, but it lies for the most part within Los Angeles county and is conveniently and appropriately designated the "foothill belt.'

The foothill belt comprises only about 450 square miles of lowlands, but between 55,000 and 60,000 acres (exclusive of the municipalities) are under irrigation, a large proportion being in citrus fruits. This irrigated land ranges in value from $200 to $2000 an acre, and may be conservatively estimated to be worth $20,000,000 to $25,000,000. In the same area there are about 40 flowing wells and nearly 400 pumping plants, representing an investment of at least $1,000,000 in wells and plants alone. It is estimated that the pumping plants supply the equivalent of 80 to 100 cubic feet of water per second, continuous flow, used largely for irrigation.

Source of Ground Waters.

The conditions that affect the occurrence and circulation of ground waters are discussed fully in Mr. Mendenhall's report, and the ground-water districts and irrigation enterprises are described in detail. Concerning the source of the ground waters Mr. Mendenhall says:

"The statement has frequently been made that the underground waters are just as dependent as the surface run-off on precipitation within the local contributing drainage basins, but the tenacity of the oft-asserted belief that these subterranean reservoirs have some other source than local rainfall makes it desirable to repeat this statement with emphasis. Each of the important subterranean basins in Southern California is supplied exclusively by the water which falls upon its surface or flows into it through some tributary stream. Any other hypothesis, as, for example, that the waters from the distant Sierra or the Colorado River or the Pacific Ocean may, by underground channels or by seepage, reach the San Gabriel valley or the Pomona neighborhood, is erroneous, and conclusions based on it are wrong and lead to a false policy in the utilization of the ground waters."

Maps of the Region.

All of the foothill belt and many square miles of mountains north of it are shown on three of the United States Geological Survey topographic sheets—the Cucamonga, the Pomona, and the Pasadena—drawn on a scale of about 1 mile to the inch. On these maps as bases all the information in regard to the water supply of the foothill belt that is capable of graphic presentation has been assembled, such as lands irrigated, chief pipe and canal lines of the various irrigating companies, pumping plants, artesian wells, a few of the domestic wells, ground-water levels (indicated by hydrographic contour lines) and artesian areas past and present.

RURAL TELEPHONES.

Rural free delivery, good roads and the rural telephone, as benefits to the farmer, can hardly in equity be compared, as they are not in competition with each other. But the rural telephone is already out-stripping both of these in the number of farmers it is reaching and the ways in which it is benefiting them.

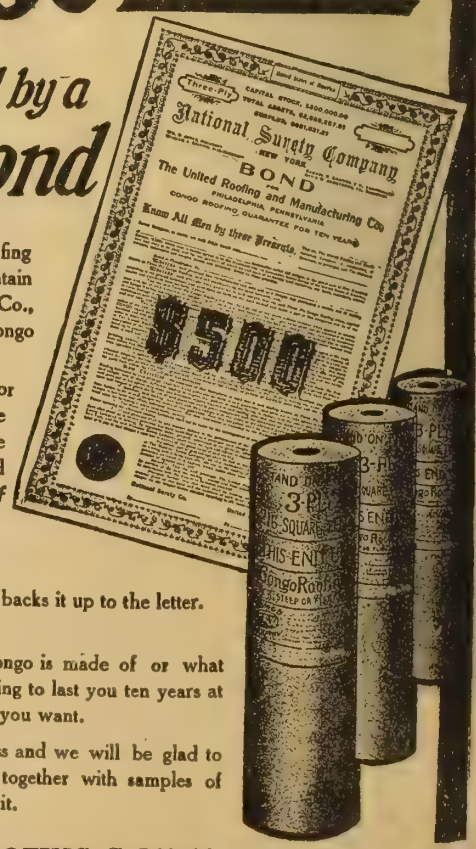
The low first cost of the rural telephone puts it within the reach of all. On lines less than 12 miles long the cost is $4.94 per mile, not including poles, the latter to be cut and furnished by the farmer. On lines over 12 miles long the cost is $6.87 per mile, same arrangement about the poles. The cost of the telephone set complete is $13.00. This represents standard "ground" one wire construction and long distance telephones. It is a simple matter to build the line and no operator is required. The annual maintenance expense is not over 75 cents for renewal of dry batteries. The farmer can run the line to town and there connect with the town exchange and long distance service.

The rural telephone in sickness or fire or other emergency enables the farmer to summon immediate aid. It gives protection to the woman alone on the farm. It saves time in doing errands. It is used a great deal for social intercourse, everybody being able to "get in" on the line at the same time if they so desire. The farmer learns the market prices and so gets more for his products. It is customary to furnish weather bureau reports each morning. For instance, at nine o'clock the telephone company in town gives three long rings over each rural line entering its exchange and those who desire may, on taking the receiver down, hear the weather report read. Prevailing market quotations are also often given out at this time.

There are about seven million farmers in the United States; of these more than two million have already adopted the telephone and its use is being rapidly extended.

CONGO *ROOFING*

Backed by a Surety Bond



Hereafter every roll of Congo Roofing which we sell will be found to contain a Bond of the National Surety Co., guaranteeing the durability of Congo Roofing.

Our 3-ply grade is guaranteed for ***ten years*** and provides that if the roofing fails to give satisfactory service during that period, you are entitled to a complete new roof ***free of charge.***

We cannot dodge this guarantee.

The Surety Company's capital backs it up to the letter. It gives you absolute protection.

You don't need to know what Congo is made of or what it looks like; you know that it is going to last you ten years at least, and that is the kind of service you want.

Let us have your name and address and we will be glad to send you a copy of the guarantee, together with samples of Congo and booklet telling all about it.

See That Patent spring?

It means much to the fruit grower who realizes the need for effective spraying, but deplores the ordinary pump with its exhausting labor, its unsatisfactory spray and its continual clogging and bother. This spring is found only in

Bean Magic Spray Pumps

It would be found in others, but the Bean Patents prevent it. This spring divides the work, permitting the operator to do half the work at each stroke of the handle. And he works against but half the pressure indicated on the gauge. It saves just one-third the labor. Two sizes of Bean Magic pumps; both have Bean patent spring, non-clogging ball valves, and other exclusive features.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

Spineless Cactus.

What is your opinion of spineless cactus as feed for cows? Will it grow well on good, strong land without irrigation?—F. D. S., La Habra.

As I understand the spineless cactus it is not recommended for soil like you possess. Surely on your land this wet season a good and valuable crop can be grown of hay or of sorghum or something less costly than cactus. The first cost of the plant at present prices would mean a large sum. The leaves are eaten and that means the plant. If used for fodder it could not be used to propagate more plants so that the cost of enough to grow feed for even one cow would probably buy several seasons' feed for her. Any crop that can be sown is always less expensive than one that must be planted by hand like shrubbery. As I understand it the cows are not allowed to browse on it but it is cut and hauled to them. Do you want my advice? Well, if I was going to try it, I should buy $5.00 worth of cuttings and try to grow from them. These would be enough to test it and then if I found it good I should hope that so many others had bought it also that I could buy more cuttings at a more reasonable price. That it will grow and that the cows will eat it is assured, but will it pay you to grow it? I cannot decide that question for you. I know it would not pay me to do so.—M. E. S.

Feed for Cows.

How can we provide an ample supply of good hay for the coming year? Have some alfalfa and much bermuda plowed, some sown to barley. A field almost ready has a portion quite tinged with alkali. Would it be advisable to seed with barley and field peas, or with oats and peas, trusting the peas to provide hay should the barley not do well? Would there be any difficulty in "curing" the barley and peas together? Or would it be better to seed simply barley now and the peas or sorghum or corn later, after the barley is cut for hay?—M. R., Fresno.

Why not use some gypsum on the alkali land? Four hundred pounds to the acre will keep it from corroding the stems at the surface of the earth if it is only tinged with alkali. Corn and sorghum seem sensitive to alkali. I do not plant them if the land is at all impregnated with it. Barley will stand considerable and sugar beets more than any other thing I know of, excepting bermuda grass. Peas and oats do better together than peas and barley. The peas come first and grow rapidly and the oats come on later; when the barley is sown with the peas it comes first and crowds the peas badly. There is no trouble in cutting or curing the crop; it dries readily. We cut it when the cereal is ready without regard to the peas. We are anxiously waiting for the ground to be dry enough to put the peas in on a piece. We will plow the land with the pony gangs, using four horses, then plant the peas with the corn planter, broadcast the oats and harrow it in lightly, aiming to put the peas about four inches deep in the loose soil and planting them four or five seeds every three or four feet, in rows three feet apart; this will take about 20 pounds to the acre, and then thirty to forty pounds of oats will be used. The peas are the common green pea. The red or black oats grow better than the white oats for this purpose.

Sorghum or Indian corn come as the summer crops on the same land, and either can be sown any time from April first to July and give abundant yield.

Do not mix the cow pea with the common pea; the cow pea is a bean and only does well in the summer in this valley. For a hay crop why not use sorghum? It cures very well with us. We plant it in drill rows in April, and when it is four or five feet high cut it with the mower, haul it away and dry it. The mower is set high enough not to cut below the first joint. The field is then irrigated and cultivated until the sorghum grows up when it is again cut. Usual seasons it will give three cuttings and a large amount of fall pasture. The hay is liked by all the stock, and with the cows ten pounds of it with ten pounds of alfalfa hay balances up their feed very nicely.

Of course we have nothing we can grow that will pay for feed equal to alfalfa; then comes Indian corn; then I try to fill every corner I can with pumpkins. They seem to grow in the night here. The heavy crook neck Cushaws are the most profitable; we have them good and sound now, long after the big round fellows have all perished.—M. E. Sherman.

Scale on Berry Bushes.

I have about 1½ acres of nice young raspberries, planted last year, but a great many of them are badly affected with white scales. How shall I exterminate the scales?—J. P. J., Ventura.

Kerosene emulsion will destroy them. It can be bought in concentrated form from almost any prominent seedsman for about 25 cents per gallon and is ready for use by adding 25 to 50 parts water to one of emulsion, according to what is sprayed. Plants should be dormant when sprayed and for raspberries 1:40 would be strong enough. If it were my case I should spray twice at an interval of two weeks.—Q. A. L.

Black Scale.

Enclosed you will find leaves from the Veronica which are infested on the under side with small brown insects resembling aphids. Please give me name and a remedy. Will Veronica bear pruning?—M .D. W., Alameda.

If there were any aphis on the leaves when they were mailed, they were crushed and destroyed in the letter. But there are abundance of the young of black scale and the accompanying fungous growth which is induced by such insects. The scale is easily killed by spraying with kerosene emulsion. The Cultivator has given instructions regarding its mixing, or if you want only a small quantity it may be had of any seedman and may be diluted and applied through a spray pump according to di-

rections. It will stand a dilution of 30 to 40 gallons of water to one gallon of the mixture which you will buy.

Suckering Date Palms.

Have several hundred date palms 5 years old around edge of fence, the major portion being males. Some of these males have as many as ten suckers, some of which are very large. I have pruned these suckers off even with the original trunk, leaving original palm intact. Will you kindly advise the cheapest way of preventing these suckers coming out again without injuring the original palm? It is entirely too expensive to take them off with a chisel as in the case of a female.—Subscriber, Phoenix.

Mr. Rixford of San Francisco answers: At the age of ten to twelve years the date palm usually ceases to throw out suckers, therefore in this case there seems to be nothing to do but to be patient and let nature take her course.

A few days ago the writer saw a large date palm at Modesto, on which the offsets had been suppressed by cutting them off near to the trunk, without the use of a chisel. The old stubs were three or four inches in length, but all dead, though not ornamental. In this case it was unfortunate that the palm had ceased to sucker, as the fruit was two and a half to three inches in length and an inch in diameter—one of the largest ever seen in California. The season at Modesto is not warm enough nor long enough to ripen the fruit; so that by constantly suppressing the suckers the chance to propagate, perhaps what would be a valuable variety, is lost for ever.

Grafting—Colure.

I have a vineyard of Mission grapes nine years old. Would like to graft to other kinds. Can it be done and how? I also have peaches same age and would like to change. Can this be done? Should Muscats be sulphured in the Pomona valley? If so at what time? I sulphured mine last year at blossom time and bunches did not set full but were long and ragged. Was it caused by sulphur?—A., Pomona.

Your first question was practically answered by Mr. Mills two or three weeks ago. In theory a vineyard may be grafted but in practice it does not work well and the best way will be to uproot and plant new vines. Your second query may be answered in the same way. That is, peach trees nine years old have so short a lease on life that it would not pay to cut off tops and graft to plums or other fruits. Muscats should be sulphured to protect from mildew, which may be done soon after leaves start in the spring and occasionally thereafter as may be needed. The sulphuring was not the cause of your straggling bunches of grapes, neither will lack of it make the trouble any worse. The cause was probably colure, which is a disease or a physical condition which is not fully understood and no remedy is described for it.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Right of Way.

I bought a piece of land and in the deed was a clause calling for private right of way 20 feet wide along the east line so my neighbor (back of me) could get out to the public road.

He has since bought a piece of land so he has a strip 500 feet wide clear to the public road, so I want to fence my place and expected to put a gate at each end of the 20 foot strip, so he can travel that way if he wishes.

Can I put up the gates and does he have to shut them? And having land of his own clear to the road does that make his private road over me null and void?

If a man has a lot in town can he plant it to blue gums without consent of surrounding lot owners, and if he plants and there is no objection for a year or two and then someone buys a lot or a present owner kicks, does he have to chop them down?—G. B., Nordhoff.

If a private right of way is reserved by the deed conveying the land you mention, the effect is the same as though you had granted to the party for whose benefit the right is reserved a right of way, and you have no right to obstruct his travelling along said right of way by gates or otherwise, unless such right was reserved to you in the contract or deed.

The fact that he has since bought a strip of land, which gives him access to a public road, would not change his right with respect to the way previously granted or reserved.

You have a right to plant trees upon your town lot, and adjoining owners cannot require you to remove those trees, but such circumstances might arise as would entitle an adjoining owner to damage because of overhanging trees or the extension of roots on to his property, and I cannot answer your question in full without having a more detailed statement of facts.—E. L. Payne.

Married Woman's Rights.

What are a married woman's rights to property in this state? Property purchased since marriage and by savings on the part of both, but deed to same in husband's name, he having died, leaving no will.—Subscriber.

Answering query of subscriber concerning married woman's rights to property in California, purchased after marriage, out of savings on the part of both husband and wife, but deeded to husband at the time of purchase, and the husband having died leaving no will, I would say that it would be necessary to have the estate of the husband administered upon by the proper court, and that after the payment of his debts, family allowance and the charges and expenses of administration, one-half of

Foxtail for Silo.

I had thought of building a silo this spring and my idea was to fill it with the first cutting of alfalfa, which means principally foxtail. Can I cure that as silage? Will it be absolutely necessary to get a cutter and power, or could it be packed in, as it comes from the field? At what stage would it be best to cut it, green, medium, or well advanced? Would foxtail beards have any objectionable qualities after being made into silage?—Subscriber, Hanford.

Have the readers of the Cultivator ever tried siloing first crop alfalfa in which there was about 60 per cent foxtail? I am preparing to put a crop in as soon as it is ready so that I can use it for summer feeding. The whole San Joaquin valley is overrun with foxtail. It spoils all of the first crop hay. Thousands of tons of it are burned annually on account of the sharp beards that go through the jaws of the horses and cattle and it is a pest to every animal. I have skined sheep and found foxtail heads had gone clear under the skin and into the flesh. At the present time the whole valley is green with it and it is an excellent cow food until it begins to ripen, then it must be burned. If cut before the heads are ripe it will head again and spoil the next crop of alfalfa. Will not the heat and moisture of a silo soften the beards and make a good feed of it? There is enough of it burned annually to keep all the cattle in the valley if it can be utilized. I have seen a few horses who were able to handle it without its injuring their mouths and they invariably kept fat on it. I am going to experiment with it but would like to hear the experience of any one who has tried it.—B. F. B., Bakersfield.

Both the above are answered in Mrs. Sherman's article on Dairy Page last week.

Cow Eats Wood.

I would like to ask the cause of a cow eating wood. I have two cows and a yearling, loose in good sized corral. Feed dry alfalfa and citrons. They seem ravenous to eat wood, get hold of a lath or piece of board and devour it. What will stop them of the habit?—G. R. S., Santa Ana.

These cows need some rougher food to help in regurgitating their alfalfa hay. If you can give them a little coarse grain, hay or straw, or failing that some fruit tree wood prunings they will stop eating boards. I have sometimes given them bone ground up when they showed excessively depraved appetites.—M. E. S.

Gum Disease.

I send pieces of bark of different peach trees in my orchard. Please examine these and give explanation what to spray with and at what time.

Please advise me in regard to vines what to use to take off moss and keep in a healthy condition.

I've been taking your paper for a long time and find it a leading paper and wouldn't be without it. I would advise all of the growers to subscribe for the Cultivator.—Henry Barkema, Oleander.

Prof. Smith answered a similar question in last week's paper, page 138, to which the inquirer is referred, and in addition he now adds regarding this case: The samples of peach bark included with the letter of your correspondent from Oleander do not show anything specific as to the trouble with the trees. It is very probable, however, that this case may be similar to that which was referred to in a former query, as it occurs in a section which is subject to the same conditions.

In regard to removing moss from vines, I would say that the Bordeaux mixture will do this very effectively. —Ralph E. Smith.

Apple Troubles.

My Pearmain apple trees bloom full and set fruit which all fall off in a short time. They have been doing this for four years. The trees look healthy but die here and there by turning black at the trunk. The land is rich bottom land 18 to 20 feet. Can you tell me the cause and remedy?—C. M., Arroyo Grande.

No doubt your apples drop on account of mildew. This comes as a white covering on the young fruit and leaves. Your trees die, no doubt, from blight, the same as pear blight. The branches and trunk turn black as you describe. For mildew, spray with Bordeaux mixture before the leaves or bloom come out, and again shortly after the greater part of the blossoms drop. This spraying can be combined with the first Paris green spraying for codling moth. The blight can only be held in check by cutting out and burning all affected wood.—J. W. M.

Plums.

What is the best shipping plum to plant that will do well here? I am ten miles east of Fresno. The land is sandy loam. I want a large plum with beautiful color that is attractive to the eye. Would you favor such a plum as the Yellow Egg, which I am told canners buy and is also a fine shipper. I have had recommended the Wickson, Tragedy, Giant Hungarian, and others. It is my design to plant these trees along a ditch bank. They would be more out of the way if on the top of the bank. If cultivation is necessary, it would need to be done with a hoe. Would they do best on top of the bank or by the side of it? —W. J. P., Sanger.

Plant Hungarian prunes. If the ditch bank is situated along a water course, cultivation will not be necessary, in which case use Myrobalan roots. If no water is running along your ditch banks, cultivation is necessary.—J. W. M.

Concord Grapes.

What is the best way to plant Concord grape vines? I have been pruning them the way I think best but they don't bear well.—D. C., Los Alamos.

Concord grapes should be pruned long and grown on a trellis or arbor. Prune so as to leave canes of last year's growth two or three feet long or with five or six buds. At the base of each of these or near the base leave a short spur with two buds on last summer's canes. These will provide a long cane and one for a two bud spur next pruning time.—J. W. M.

Fertilizer for Potatoes.

I have grown potatoes on a rich sandy loam for three years. Am not situated so as to rotate crops and would like to know how best to fertilize to best advantage for this year's crop, also potatoes. Should I use complete fertilizer or will a potash be sufficient? Is not stable manure objectionable because of fungous troubles it may carry into the soil?—F. K. D., Compton.

In order to get the best results from the soil you must plan to keep up a supply of humus. If we allow the fear of fungous troubles to deter us from using stable manure it will inevitably result, after a time, in crop failure. I should prefer a complete fertilizer if I were depending on anything aside from stable manure, Potash alone would not be adequate any more than nitrogen alone or phosphoric acid alone. I should have little fear of fungous trouble from the use of manure if the seed was good and properly treated before planting. This refers to potatoes.—Q. A. L.

It pays to know
Trinidad Lake Asphalt is nature's perfect waterproofer.
Genasco
Ready Roofing
is made of Trinidad Lake Asphalt. You know it will last and give your roof absolute protection.
Do you know that much about roofings made of "secret compounds"?
Be on the safe side and get the roofing with lasting life, backed by a thirty-two-million-dollar guarantee. The most economical roofing for every building on the farm. Mineral and smooth surface. Look for the hemisphere trade-mark, and insist on Genasco. Write for the Good Roof Guide Book and samples.

WANTED—TO BUY ALL .KINDS .OF early vegetables from growers direct. References, Wells Fargo and any bank. MRS. M. VETTER, Santa Maria, Cal.

BULLS.

FOR SALE—ONE REGISTERED JERsey Bull. Dam has given 6,300 pounds of milk with this, her first calf. Price, $50.00. GEO. W. THOMAS, West Central Ave., Riverside, Cal.

ARTICHOKES.

FOR SALE—JERUSALEN ARTIchokes, the great winter hog feed. Address, FANCHER CREEK NURSERIES, Fresno, Cal.

the community property would be distributed to the surviving wife.

This is a case in which the subscriber should consult a reliable attorney without delay, as a court proceeding is necessary.—Edw. L. Payne.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Distemper in Dog.

I had a dog which died apparently of poisoning. First he began to discharge watery substance from his mouth, which continued for nine days when he died. He had short coughs occasionally. Had no appetite, would eat nothing the last few days. His throat seemed to be badly inflamed, could hardly swallow. Bowels showed some blood toward the last. Was it a case of distemper or slow poison? Gave lard and sweet oil, also a solution of lard and coal oil and also sulphur. He did not suffer much until the last two days.—C. N., Moneta.

It was probably distemper with bowel and lung complications. Distemper has almost as many forms as there are different dogs, and very few dogs escape it as it is very contagious although one attack renders immunity to a subsequent attack, like measles or small-pox in the human.

Vertigo.

Will you please note the following symptoms and see if you can ascertain what is the matter with our mare: Age twelve years; weight 1050; probably has considerable German Coach horse blood; is a splendid driver, rather speedy; but when left at hitching post for any length of time will stagger and fall as though she could not see. The attack is usually over in a minute or two and then she goes along as though nothing had happened. When being unhitched she has acted as though she were asleep and on two occasions has fallen in her tracks. There is a peculiar condition of her eyes which may have some bearing on the case; the iris seems to be nearly closed by some overhanging warts which leave only a small opening at either side. Her bowels are generally constipated. These attacks seem to occur when she is not worked and is not getting much exercise. We use her in vineyard work and at such times she seems quite well.—C. D. H.

The condition you describe is a vertigo, caused by a congested condition of the brain and may be from different causes, poor return circulation of the blood from the head, or it may be from a diseased liver. There seems to be no treatment that does much good. The little bodies you see in the eye attached to the iris are the Corpora Nigra, or soot balls. If you look at your other horses you will find the same thing. You are not the first one to think he has made a discovery.

Sores from Needle Grass.

My mule has a running sore from the root of her tongue to the outside under her lower jaw. It has a very foul smell. Was caused by eating needle grass. I have been washing it out with carbolic acid water.—E. E.

Sores such as you describe are very frequent in California from eating barley hay, foxtails or needle grass. There is a mass of them lodged in the sinus and it can not

Possibilities of Arizona

Mr. H. G. Hutchins, a representative of the Cultivator, has been spending a few weeks visiting the more productive sections of the Gila and Salt River valleys in Arizona. His stay in Yuma and a view of the agricultural lands thereabout was very limited. However, from his observations there we quote below and later give other items secured in his visit about Phoenix and Tempe. On first page of cover this week will be seen a view of the Granite Reef Dam, about 25 miles east of Phoenix near the mouth of the Verde river. That dam has no comparison, of course, with the Roosevelt Dam farther up which will cost in excess of six millions of dollars. These irrigation facilities in the territory of Arizona are increasing more and more the productiveness of the wonderfully rich valleys along the river bottoms. We hope to have more information regarding Arizona agriculturally from Mr. Hutchins in a later issue.

The Yuma Valley is coming to the front. The Cultivator representative has just made a carful investigation and canvas of the section and finds conditions most promising for the future.

The Laguna Dam.

The great Laguna dam is about completed, and as soon as the siphon for conveying the water across the Gila river is ready, will supply water to irrigate 100,000 acres and over. At present only a part of this acreage is under cultivation though practically all is taken up and the owners ready to commence operations as soon as the water is ready. There are enough however in the field to determine the great productiveness of the soil. Practically everything can be grown. Yuma oranges are fine. Alfalfa is probably the most common crop and demands good prices. The melon industry had a setback on account of the poor returns last year and not near the acreage is to be put out that was last year. The writer's impression is, however, that this would be a good year for that crop.

The experiment station under the supervision of Prof. Forbes of the University of Arizona is doing a good work in the valley in determining the values and adaptability of various crops. Cotton has been grown on test and by many it is believed that it will become quite an industry, as the conditions seem to suit it. As yet the produce of the valley is only sufficient for local consumption and not always equal to that. A local creamery uses the dairy output of several ranchers with capacity and demand for more. The prospects for the rancher in the valley are surely bright and the Cultivator notes with pleasure the great progress which is being made toward making the desert bloom. The word desert, however, is misleading, for the examination of the soil does not warrant its use. Instead of a light sand as one would expect, one finds as nice a sandy loam as can be found any place in the west.

* * *

The Secretary of the Yuma County Water Users' Association writes regarding these lands:

"That all of the public lands on this side of the river have been filed upon or are claimed by some one, but some of these claims are for sale. The Yuma Indian Reservation on the California side just opposite the town of Yuma will be open for entry when the water from the Laguna Dam is ready for delivery. The plan to be adopted by the government in opening the reservation has not yet been announced by the department. Forty acres or less will be the greatest amount allowed to any one person. The cost of the water rights on these lands will be from $35.00 to $40.00 per acre. Twenty acres of this land with a sure water supply is considered ample for any family to make a living on. If you wish to buy patented land it will cost from $30.00 to $150.00 per acre according to location and distance from town and the improvements that are upon it. Patented lands are lower now than they ever will be in the future, due to the fact that a great many old settlers have more land than the reclamation act will allow them water for, consequently they must sell within the next two years.

"The climate is without compare for nine months in the year; the three summer months are very hot, but as it is a dry heat people do not suffer and such a thing as a sun stroke is unknown.

"The Yuma Project will be completed, as near as we can now figure, about December 1909. The government has already given us a water supply for 15,000 acres and with gravity water from the dam in the near future, the year round, this valley will be a garden spot in a few seasons. No other valley in the entire country is so favorably situated. With almost continuous sunshine, a soil that has no equal, and cheap and abundant water, nearly everything is possible."

At Phoenix.

Phoenix is the largest city in the territory of Arizona, and is located on the Salt River in the midst of a wonderfully productive farming section. Near it are lands which have been wealth producers in the production of alfalfa, and in the matter of citrus fruits are beginning to attract attention to the fact that many most profitable orchards are already established. Population of the city is now in excess of 18,000, and has its greatest population in the winter time when many Eastern people flock there because of its delightfully healthful conditions.

The Salt River Valley has within it about 200,000 acres of land in private ownership. Only three-fifths of this area now is cultivated, for the Salt is an erratic sort of stream. For weeks its flow may forbid passage at any ford, and yet within a month the traveler may cross dryshod. The land generally is magnificent in quality, capable of growing almost any fruit or grain, and sloping so uniformly and so readily adapted to irrigation that there are theories that possibly the ancients leveled the farms, with resultant benefit to a people who followed them ages after.

Salt River Valley.

The waters of the Salt River which pour in such floods during the wet season are already being stored by the great Roosevelt Dam. This dam is already at a height capable of storing 100 feet deep of water, and is planned so that when finished its height will be increased to 284 feet. It is 1080 feet on the roadway that will cross its crest. Practically, it will be a single solid stone, of 340,000 cubic yards, without openings, keyed firmly to the walls and the rock beneath the river bed. The cement for it is made upon the ground, the Government finding it better to build its own mill than pay exorbitant prices demanded for an article already in light supply. No water will pass over its crest, for waste ways have been arranged for that will handle any flood known to history.

The dam and reservoir works at Roosevelt and in this valley will cost $6,000,000, including the cost of the new irrigation works that will be required in the valley. The cost of these great works is being advanced by the general government from the fund that has been gathered by the sale of lands in the West, but every cent is to be repaid by the land-owners in a term of ten years, without interest, commencing with the completion of the dam.

In fact we believe the recent action of Congress has extended this period of ten years which will make the payment for this great improvement less burdensome. The land-owners have banded themselves into a Water Users' Association, through which the government is being dealt with. About 200,000 acres of land are represented in its membership. Thus the tax upon each acre per annum will be about $3. It can be seen most readily that the added crop return from an absolutely assured water supply, when irrigating water is needed, will far more than return the farmer his annual assessments.

(Continued on Page 207.)

For Larger Crops and Richer Soil at Lowest Cost—Fertilize with

FARMOGERM

High-Bred Nitrogen-Gathering Bacteria

You know that the big crops are the result of plenty of nitrates in the soil. And you know that nitrates are what cost most in commercial fertilizers. Then let us show you how you can solve this great problem and supply your soil with enough nitrogen to supply several bumper crops, at the low cost of $2.00 an acre, and

Without Extra Work

Get our free book, reports from high authorities and many farmers who have tried it and **know.** We can prove every claim. The U. S. Department of Agriculture states that the pure culture method of soil inoculation has "come to stay." Farmogerm **is** a pure culture of nitrogen-gathering germs that have been carefully selected and bred up to a state of strong vitality and great nitrogen fixing power. That is our guaranty. Farmogerm is a jelly-like culture, put up in specially sealed bottles, guaranteed to reach you in perfect condition and to keep for months.

Trial Bottle for 10c

Make Box Test in the House

"Seeing is believing"—and so for 10c in stamps we will send you enough Farmogerm, with full directions to make a test with before planting time. Mention crop you will use it for.

It Is Ready for Use

when you get it. Just mix with water and moisten the seed or spray on soil or young plants. The bacteria will increase rapidly, by the millions, in the soil, and draw nitrogen from the unlimited supply in the air, feeding it to the growing crop and storing it in the soil for future crops.

Alfalfa, Clover, Peas, Beans, all legumes, thrive best and enrich the soil in nitrates for future crops only when well supplied with their special bacteria. Otherwise they drain the soil instead of enriching it. Because Farmogerm supplies the right bacteria in the right way and in the right form, it increases the yield and the food value of the immediate crop, and

Makes Poor Soil, Good Soil

Write today for Free Book No. 37, which gives full information. Mention the crop you wish to inoculate. Or send $2.00 for a bottle for one-acre treatment, or 50c for garden size for peas, beans and sweet peas.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm. Wherever the Gypsy or Brown-tail Moths, Tussock Moths, Fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

THE O. & W. THUM COMPANY

Manufacturers of Tanglefoot Fly Paper — Grand Rapids, Michigan

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

BATTLE OF BUNKER HILL.

The seventeenth, at break of day,
The Yankees did surprise us
With the strong works they had thrown up
To burn the town and drive us.

But soon we had an order come,
An order to defeat them;
With three good flints and sixty round,
Each soldier hoped to beat them.

At noon we marched to the Long Wharf,
Where boats were ready waiting:
With expedition we embarked,
Our ships kept cannonading.

And soon our boats all filled were,
With officers and soldiers,
With as good troops as England had,
To oppose who dare control us.

And when our boats all filled were,
We rowed in line of battle;
With grenadiers and infantry,
While grapeshot loud did rattle.

And when we landed on the shore,
We formed in line together;
The Yankee boys then manned their works,
And swore we shouldn't come thither.

Brave General Howe, on our right wing,
Cried, "Boys, fight on like thunder;
You soon shall see those rebels flee,
With great amaze and wonder."

But such stout Whigs I never saw;
To hang them all I'd rather
Than mow their hay with musket balls
And buckshot mixed together.

As for their King, that John Hancock,
And Adams, if they're taken,
Their heads for signs we'll raise aloft
Upon their hill called Beacon.

But our conductor, he got broke,
For his misconduct, sure, sir;
The shot he sent for twelve-pound guns
Were made for twenty-fours, sir.

—A British Soldier.

THE MYSTERY OF LIDA.

MRS. DILPECK paused, hand in air over her daughter's dresser, paralyzed for the moment. She had wandered in as usual to banish the disorder which Lida always left behind her and for the first time that her mother could remember there was nothing to straighten up. The top of the dresser was in precise array, not showing even a collar bow or a hairpin thrown down carelessly. The mirror surface itself was dusted.

"Well!" breathed Mrs. Dillpeck. "Well!"

The phenomenon came back to her mind several times that day, but Lida was down town shopping, so Mrs. Dillpeck said nothing. In fact, all her life Mrs. Dillpeck had said nothing.

For one reason, Lida was so very pretty that the sternest resolutions melted to treacle at her smile and it was easier to follow around doing the things Lida should have done than to scold her about the omission. And then, to her mother, Lida was still a mere child, who doubtless would reform when she grew up.

Asking in a rather hopeless way that afternoon whether Lida remembered to get the silk she wanted and receiving an affirmative answer from that young person, Mrs. Dillpeck was actually alarmed.

"Does you head ache, Lida?" she inquired. "You are sure you aren't feverish or anything?"

"Good gracious, no!" her daughter told her. "I never felt better! Why?"

"Nothing," said her mother. "There's so much sickness around. I just hope you aren't going to be sick!"

* * *

Two days later Mrs. Dillpeck had another shock. Entering the library, she found her daughter rearranging the tables and chairs.

"Don't you think it looks homier this way, mother?" asked Lida.

Up to that time Lida, with her laughter and harumscarum ways, apparently had never observed whether the chairs were placed on the ceiling or side walls, not to mention the floor.

Mrs. Dillpeck sat down heavily.

"I guess so," she said, anxiously, as she gazed at her daughter.

The rose bloom on the check was perfect, the eye was bright. Still, Mrs. Dillpeck was not satisfied. She felt Lida's pulse.

"I just know you're going to be ill or something," she lamented. "Oh, I don't know—I have a feeling! No, you look all right, but one can't tell by that. I never saw any one look better than my own cousin the very day before she was taken down with typhoid!"

It was the cook's day out and when Mrs. Dillpeck started into the kitchen to prepare the family dinner Lida followed her. There was a hesitant look upon her face and she stumbled in her speech.

"Mother," she said, "won't you please let me get the dinner tonight? Honestly, I'd like to try! I never have, you know!"

Mrs. Dillpeck held to the gas range. Through her mind flashed the succession of Thursdays since Lida had grown up and the cook had been out. A book or a call always had interfered with her mother's desire that her daughter should learn to keep house. It had always seemed too bad to break into Lida's engagements. And now—

She gazed, mystified, at the beseeching young creature before her, whose yearning eyes were on the saucepans.

"Why, you'd spoil everything!" objected Mrs. Dillpeck. "You run along—I don't mind doing it!"

"You never let me," Lida mourned, rebelliously. Then she brightened. "I can set the table, anyhow!" she said triumphantly, and darted into the dining-room.

Mrs. Dillpeck was so preoccupied that she salted the coffee and flavored the custard with onion extract. Certainly something was wrong with Lida! The child's conduct was unnatural and her mother was vaguely worried.

After dinner, when Lida had departed for the theater, her mother sat thinking and frowning.

"What's the trouble?" asked Dillpeck over his evening paper.

"I don't know," confessed his wife. "I don't feel right about Lida. She seems well, but I'm afraid she's coming down with something. She doesn't act like herself!"

"Pooh!" said Dillpeck. "She looks well and happy to me! She's all right!"

"You haven't got the eyes of a mother," said Mrs. Dillpeck. "To crown it all, I found her trying to cut out a shirt waist this morning, and she has always loathed sewing! And she was singing—actually singing, over it. Then you try to tell me!"

"How do you make mince pies,

mother?" Lida asked the next night, at dinner.

Even her father stared. "My!" he said, with clumsy playfulness. "What's struck you?"

Lida blushed. "I just wanted to know," she said.

* * *

It was the next day that young Flickworth broke the news to them that he and Lida wanted to get married. After the excitement had calmed down Mrs. Dillpeck wiped her eyes and smiled a watery little smile.

"Anyhow," she said, "I'm glad it's only matrimony and not typhoid fever that made Lida act so odd! I knew it was something!"—Chicago Daily News.

About the House

One of my duties for February, since I have been living in the land of oranges, is to make orange marmalade. Perhaps I could make it just as well in January or March, but I never do. I have always used the one recipe and the marmalade is very nice, but I like to try new ways and if some of the Cultivator readers send their tried recipes it would benefit not only the writer but a host of others. I contribute "my way" of making orange marmalade.

Take firm oranges and slice just as thin as possible and to every pint of the sliced oranges add three pints of cold water and let stand twenty-four hours. Then cook until you can pierce the rind with a straw, then set aside for another twenty-four hours. Then for every pint of this take a pint of granulated sugar and cook it until it "jellies." Then put in jelly glasses and cover with paraffine. I usually put in a few slices of lemon, about one lemon to every six oranges, but it is not necessary. Don't slice too many oranges to begin with. I had every crock in the kitchen full the first time I tried it, for I made no allowance for the three pints of water to each pint of oranges.

And if any one knows how to prepare the candied orange peel, I wish they would tell the Cultivator family.

Do not forget that "Washington Pie" is an appropriate dessert for dinner on February 22. It is a dainty quite worthy of being named for our first president. Bake any simple cake in one thick layer and while still hot split in two pieces. Spread one piece with a thin layer of jam and a thick layer of custard. Place the other half of the cake on the custard, spread with jam and sprinkle generously with powdered sugar. To make the custard take one cup of milk, one egg well beaten, one teaspoonful of corn starch dissolved in a little of the milk, add sugar and flavoring and cook until thick.

Kitchen holders made of ticking or any heavy cotton goods are quickly made and easily washed when soiled. Cut two thicknesses of cloth about five inches square, stitch all around and put a loop at one corner.

If your window shades are soiled and shabby and you would like to make them last until the spring house-cleaning, take them off the rollers and turn them upside down. They will look well for some time.

If you want a change from potatoes, "baked, boiled or fried," try "Club House Potatoes." One pint of potatoes cut in small cubes should be parboiled three minutes. Pour off the water, add a scant fourth cup of butter and a little pepper and salt and cook until done. Add a cup of thin white sauce and serve at once. If you have the parsley, a spoonful of it cut fine and sprinkled over the potatoes improves them both in looks and taste.

A cheese pudding is quickly made and furnishes just the hot dish that is liked these winter days. Butter a baking dish and put in a layer of bread, small pieces, then a layer of cheese, either grated or cut in thin slices, a little cayenne pepper, salt and a tiny pinch of baking soda. Repeat until the dish is full, with cheese for the top layer. Pour on milk to cover all and bake for about one half hour.

A dainty way of serving oranges is to separate the seedless oranges into sections and carefully dip each section into a sugar syrup, so stiff that it will "thread." Pile the sections on a pretty dish and slowly pour the syrup over them until they are well coated. Serve very cold with whipped cream.—Elbepe.

A QUESTION FOR HIS HONOR.

A Missouri lawyer relates the following court episode: "A colored woman was charged with inhuman treatment of her children. Evidence was clear that the woman had severely beaten one youngster, aged some 9 years, who was in court to exhibit his battered condition. Before imposing sentence the justice asked the woman whether she had anything to say.

"'Kin I ask Yo' Honoh a question?' inquired the prisoner.

"'Certainly you can', the court responded.

"'Well, then, Yo' Honoh, I'd like to ask yo' whether yo' was ever de parent of a puffectly wuthless culled child?'"

FLATTERING SCALES.

When Grover Cleveland's son Richard was born his good friend Joseph Jefferson drove over to Gray Gables to congratulate the father.

"How many pounds does the child weigh?" asked the noted actor.

"Fifteen," was the reply.

"Nine," said the attending physician, who had just come in.

Mr. Cleveland assured the doctor that he must be mistaken. "The child weighs fifteen pounds," said he; "I weighed him myself with the scales Joe and I use when we go fishing."—Success Magazine.

"Yis, ma'am," said Bridget, "I'll be lavin' ye. I don't like that snip of a dude that does be callin' on Miss Mabel."

"The idea," exclaimed her mistress. 'He doesn't call to see you, so what—"

"I know he don't ma'am, but I am afraid some of the neighbors might think he does."—Philadelphia Press.

"Why don't you get up and give that seat to your father, Bobby?" reprimanded the woman. "Doesn't it pain you to see him reaching for a strap?"

"Not on a train," chuckled Bobby. —Philadelphia Inquirer.

"Can't you find any work at all?" "Plenty, sir; but everybody wants references from my last employer." "Can't you get them?" "No, sir; he's been dead twenty-eight years."

Mayer HONORBILT

SHOES FOR MEN

These splendid men's shoes represent the best there is in shoe leather. Every piece of material is of the choicest tannage. The workmanship is perfect; the styles are up-to-date. When it comes to service, there is nothing that equals them in lasting qualities.

"HONORBILT" SHOES

are everything the name implies. They are *"built on honor."* No matter where you look, or what you pay, you will never find anything that will outclass them in wear, style or comfort.

If your dealer will not supply you, write to us. Look for the *Mayer Trade Mark* on the sole.

FREE—Send us the name of a dealer who *does not* handle Mayer Honorbilt Shoes, and we will send you free, postpaid, a beautiful picture of George Washington, size 15x20.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Feb. 17, 1909.

Butter.

Butter remains exactly as last week. It was to be lowered by resolution of the Produce Exchange, but owing to a little jobbing of the market, prices paid to the purchaser were at the reduction and supplies were then sold to trade at the former higher price. It will doubtless be marked down tomorrow.

Produce Exchange wholesale quotations are as follows with actual selling price to the trade 2½c advance on Extras.

A 10 YEAR ROOFING GUARANTEE.

In the advertising columns of this paper the United Roofing and Manufacturing Co. are offering to every purphaser of 3-ply Congo Roofing a National Surety Co. guarantee bond, which covers a period of **10 years.** This Company is one of the largest Surety Companies in the world, (capital and assets of about $2,000,000) and when they back a proposition there must be a great deal in it or they would not have risked their reputation on something about which there could be any question. The bond is a plain statement of what they can and will do, and offers such protection that no prospective buyer can afford to overlook. This bond means protection to you. It isn't necessary to buy the roofing to learn the contents of the bond—which is another pleasant feature. By writing to the United Roofing & Manufacturing Co., Philadelphia, Pa., or Blake, Moffitt & Towne, Los Angeles, they will be glad to send you information regarding same and sample free.

ARIZONA.

(Continued from Page 203.)

Alfalfa.

There are in the great Salt River valley about 75,000 acres of alfalfa. In some sections this stretches away for miles, a perennial dark green carpet. Arizona sun and Salt River water combine to make a wonderfully productive crop of this mortgage-lifter. Usually six crops per annum are cut.

Many a farmer has found the grape vine to do exceptionally well in the Salt River valley. The seedless varieties especially have ripened very early and reached the Eastern market amongst the earliest of all grapes. The warm spring sun filled them full of sugar and they were of exceptionally fine quality.

The government experiments in date culture open the way for another agricultural product which may prove a great wealth bringer.

Near Glendale in Maricopa county is a million dollar sugar factory which indicates that the Salt River Valley can grow abundance of sugar beets. This plant has a capacity of about 1000 tons of beets a day.

VETERINARY.

(Continued from Page 202.)

heal until they are removed, which is not an easy job. You should have a surgeon remove the whole pipe with all its contents if possible. Sometimes the grass can be cleaned out with a curette. No medicine will cure it until this is done. Be careful not to feed any more needle grass. If you had a curette you might clean it yourself; I think I could send you one that would do for about $1.50.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces. excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

PRESIDENT ROOSEVELT.

(Continued from Page 179.)

Need of Co-operation.

"First, effective co-operation among farmers, to put them on a level with the organized interests with which they do business.

"Second, a new kind of schools in the country, which shall teach the children as much outdoors as indoors, and perhaps more, so that they will prepare for country life, and not, as at present, mainly life in town.

"Third, better means of communication, including good roads and a parcels post, which the country people are everywhere, and rightly, unanimous in demanding.

"To these may well be added better sanitation; for easily preventable diseases hold several million country people in the slavery of continuous ill health.

"The commission points out, and I concur in the conclusion, that the most important help that the government, whether national or state, can give is to show the people how to go about these tasks of organization, education and communication with the best and quickest results. This can be done by the collection and spread of information.

"The only recommendation I submit is that an appropriation of $25,000 be provided, to enable the commission to digest the material it has collected, and to collect and to digest much more that is within its reach, and thus complete its work.

To Develop Community.

"Our object should be to help develop in the country community the great ideals of community life as well as of personal character. One of the most important adjuncts to this end must be the country church, and I invite your attention to what the commission says of the country church and of the need of an extension of such work as that of the Young Men's Christian Association in country communities.

"I warn my countrymen that the great recent progress made in city life is not a full measure of our civilization; for our civilization rests at bottom on the wholesomeness, the attractiveness and the completeness, as well as the prosperity, of life in the country. The men and women on the farms stand for what is fundamentally best and most needed in our American life."

Organize.

The president ends by saying: "Very much information of the most valuable kind can be gathered if the commission is given the money necessary to enable it to arrange and classify the information obtained from the great mass of similar answers which they have received.

"But there is one point where the testimony as a whole agrees. The general feeling is that the organizations of farmers, the grangers and the like, have been of the very highest service not only to the farmers, but to the farmers' wives, and that they have conferred great social as well as great industrial advantages."

A FAIR SPRAYER PROPOSITION.

"The farmer best knows what the farmer needs and wants," which accounts for the big success of the H. L. Hurst Manufacturing Co., of Canton, Ohio, manufacturers of Quality Sprayers and pioneers of "Free Trial without a cent in advance" as applied to sprayers. Every one of the officers of this company were raised on a farm and knew the requirements of a first-class sprayer and also that the farmer wanted a sprayer that could be used for all kinds of work and with this end in view they invented and manufactured the Hurst Man-Power and Hurst Horse-Power Combination Potato and Orchard Sprayers.

In an interview with the president, the following facts were obtained: "Regarding our machines, would say that we have three special styles. (among others) which are of special value to the fruit grower and farmer. The first is our 'Fitz-All' Sprayer; the second is our Man-Power Potato and Orchard Combination Sprayer, and the third, our Horse-Power Combination Orchard and Potato Sprayer.

"The Fitz-All has been happily named, for it fills all the demands for a pump at a very reasonable price, which will fit on any barrel, tank or other water-proof vessel.

"Our Man-Power Machine is specially adapted for either potato spraying or orchard uses. It sprays anything sprayable. Supplies chemicals to four rows at a time, and is mounted on a wheel barrow frame of hollow steel tubing. It pushes easily because of the wide, three-inch wheel. It is specially interesting and useful to fruitmen and gardeners, because it can be converted into either a truck machine or an orchard sprayer in five minutes. The tallest trees can be reached with the extension rod, and every condition of spraying or whitewashing or painting is fulfilled by this combination machine.

"Our Horse-Power Machine is a signal success. The tank holds either 60 or 100 gallons, and is made for one or two horses. It is entirely automatic and for orchard work generates its own power as you drive from tree to tree, and for potato or field work, it's the best to be had."

The above company send out a brand new catalog describing the three above machines, besides other styles which they make. This catalog is entitled, "Needn't Send One Cent." It is handsomely printed on first-class paper. Every fruitgrower and gardener ought to have this catalog. Write for it mentioning the Cultivator.

The Model Acetylene Gas Generator

Built **especially** for generating the **best** known gas for **cooking** and **illuminating.**

As Oranges Are Advertised in the East

Reduction of a Half-Page Ad Which Appeared in Many Eastern Papers

ORANGE WEEK

All Dealers Now Supplied with

Luscious "Sunkist" Oranges

for ORANGE WEEK, beginning

Monday, February 15—Special Prices Everywhere

Every reader of this paper will want to keep *"Orange Week"* in mind. The finest fruit ever grown in the famous California Orange Groves—delicious "Sunkist" Oranges—will be supplied by *your* dealer.

"Sunkist" Oranges are grown in the 5,000 orchards of the California Fruit Growers' Exchange. They are selected, first quality, full flavored, tree-ripened, hand-picked.

For juiciness and delicious flavor they are unsurpassed. Every orange is perfect. See them—give them a place on your dining table, and know for yourself how much better "Sunkist" Oranges are than any others.

Tell your dealer *"Sunkist" Oranges* are the ones you want. He will have a full supply during *"Orange Week."*

"Orange Week" is your opportunity to buy the finest, juiciest, most luscious oranges that grow, and at the lowest prices, too.

These California Navel Oranges are cultivated, picked and packed with the greatest care. Look for the name "Sunkist" on the box. This is your insurance of quality and flavor. No other oranges so choice as these.

"Sunkist" Oranges are unsurpassed as a tonic. They should be eaten morning, noon and night. Physicians recommend oranges for their food value—for the nourishment they give to the nerve and brain cells.

Oranges are the oldest of all the "breakfast foods." Other breakfast foods have come and gone while "Sunkist" Oranges have increased in favor because of their health giving qualities.

Eat the "Sunkist" brand and you will understand *why.*

Your dealer—every dealer—is prepared for *"Orange Week"* and will have a full supply of "Sunkist" Oranges—the perfect fruit of the most carefully cultivated orange groves in the world.

Remember "Orange Week" Begins Next Monday

For Health

SUNKIST ORANGES

SUNKIST ORANGES

For Health

THE above is a reduction from a half page ad which appeared in the more influential papers all over the Middle West a few days ago. It was inserted by the great cooperative organization of California orange growers. It called for the observation of "Orange Week" and its invitation was generally accepted. California oranges were talked about as never before and their consumption will be greatly increased by this shrewd step in advertising.

General Manager Woodford says: "The exchange is not attempting to put forward any special brand, but only to increase the consumption of California oranges in general, as represented by the large number of growers who are members of the exchange. We mention our trademark, 'Sunkist', in our advertising, which is on all the best grades of oranges shipped by the exchange, but in addition to this, each box is labeled with the brand under which the individual exchanges pack their fruit.

"The details of this campaign are handled by our Chicago office, but the results show up in our sales figures at the close of the season. It is an expensive proposition, as I presume it would cost $10,000 to cover Chicago alone, but we have not yet tried that."

Ranch Goods

IT IS OUR GOOD PLEASURE to manufacture and deal in a large variety of goods absolutely essential to the running of a first-class ranch;

Tents
Stack Covers
Tarpaulins
Wagon Sheets
Irrigating Hose
Picking Bags
Picking Sheets
Nose Bags
Horse Covers

We also make a line of Corduroy, Gov't Khaki and Shaw-Duck Clothing admirable for ranch wear. While low priced, these garments are far superior and more presentable than anything in the overall class. Made to measure for both men and women.

Guns, Ammunition, Fishing Tackle, Camping Goods, Carryall Bags, Holsters, Scabbards, Pouches, Cutlery, Orange Clippers, Pruning Shears, Lawn Mowers, Garden Hose, Canvas, Burlap, Rubber Blankets and Clothing, Rubber Boots, Bicycles, Bicycle Sundries, Kodaks and Photo Material.

If your dealer does not handle our goods, write us.

STABLE MANURE

SPECIAL PRICE FOR MARCH AND APRIL DELIVERY

Advise your probable requirements. We will book orders for future delivery allowing you to change or cancel on proper notice. This insures you preference and regular shipments, and lowest price during the year.

CUT OUT FOR REFERENCE

HUMUS hardly requires defining to the Orange Grower. Where it is existent in the soil you will find a profitable grove. Is your land deficient in this essential—**HUMUS?**

Commercial Fertilizer can only become properly available with **HUMUS** in the ground. An application of **STABLE MANURE** is acknowledged by successful Citrus Growers as the best and cheapest means of producing the **HUMUS** you want. We have effected a system of loading as to insure you exactly the grade of manure best suited for your soil conditions.

Also at a considerable expense and effort we have made several comparative tests, according to analysis, of the various grades of manure. Our price we fix according to the approximate unit value. In buying manure fertilizers, this point is worth your careful consideration.

Full information gladly furnished on inquiry.

Organize for Fighting Orchard Pests

Claremont Fruit Growers Organized to Secure More Competent Inspection of Orchards

ONE OF the most progressive if not the most progressive farmers' club in the State of California has been the Claremont Pomological Club, organized many years ago with Prof. A. J. Cook as president, which office he still retains, and V. V. LeRoy is secretary. The community immediately surrounding Claremont on the extreme eastern edge of Los Angeles county, which is the center at which Pomona College is established, is made up of a very intelligent, high class of people. Consequently the monthly meetings of this club have brought together a class qualified to discuss questions which confront them as producers in a most intelligent way. Usually an afternoon session is held, but sometimes an all day picnic is planned and the entire neighborhood joins. Something over seven years ago in this club was started a movement for a local co-operative telephone exchange with headquarters at Pomona, three miles and a half away. It was at first determined that unless fifty members joined this association a start would not be made and we know a great effort was required to secure that number to make this start. Today this same co-operative telephone system is operating more than 2500 phones, and at an exceedingly low cost to the members.

The same club inaugurated a movement a few years ago for more reasonable fertilizer laws than the state had ever had up to that time. Mr. Frank Palmer and others of the committee worked hard and through their efforts and backed by the united efforts of this club, the present fertilizer law was carried through the state legislature.

At this time the club is showing its power to accomplish good for its community by taking up the question of orchard inspection and uniting in studying up a plan of combating the orchard pests which threaten all citrus sections and eradicating if possible such as have secured a foothold and preventing the introduction of others. Especially was the effort made to secure competent and trained men in the offices of inspectors and county horticultural commissioners. A committee was appointed, consisting of V. V. LeRoy, Pomona, W. A. Johnstone, San Dimas, Dr. Vincent Baker, Pomona, Mr. Daniel Durkee, San Dimas, to investigate the situation and report. The work was inspired more particularly by the danger which confronted them by the mealy bug which has proved disastrous in some orchards in California. The meeting at which this committee reported was so important that a bulletin devoted to "Mealy Bug and Fumigation" was issued. It is a very valuable publication and should lead to an awakening as to the danger which confronts citrus growers from this pest.

Mr. C. F. Baker reports in the bulletin regarding the work of the inspectors employed as follows:

Trained men—men with careful and practical technical preparation—are universally considered an absolute necessity in all of the most highly developed industries. Why not, then, in the orange industry, where millions are invested? It is to the efforts of men of thorough technical training that we are just now indebted for opening up to us entirely new possibilities in the matter of effective fumigation. Our whole inspection

(Continued on page 218.)

Controlling Some Pests of the Orange

Observations on Sprays and Gas Treatment By Charles E. Beemis of Covina

There has been much inquiry as to control of mites and of scale on orange trees. New comers into California necessitate much repetition on the part of the newspapers as to cultural methods. As a rule all the scale pests are now given the hydrocyanic acid gas treatment. The mites and red spiders are another problem and are best treated with sprays.

Wishing reliable information we have asked Mr. Chas. E. Beemis of Covina, one of the Horticultural Commissioners of Los Angeles County, to give us a short article on the subject. We trust we may later have another article from him on the silver mite.

I AM somewhat at a disadvantage in treating this subject as I can not (in the light of our present knowledge) conceive of conditions which would make it desirable to treat either of these pests upon citrus trees with sprays, except it be that sulphur sprays are meant for the two mites named.

Dust Spray Good.

I will say that in the case of the mites, they have no regular season of development. Their breeding in serious numbers occurs only when temporary favorable conditions invite a sudden great onslaught upon tree or fruit when the few making up the slight infestation become myriad by their deposit of millions of eggs, each of which may produce a spider in a few hours. These "favorable conditions," however, are more apt to occur just after blooming of the trees in the spring, and again in the fall after water becomes scarce and trees get dry. Little fear of mites need be felt in continued wet weather.

None of the oil sprays kill the eggs of mites, most of the killing done being by reason of the force of the spray knocking the mature mites off on to the ground, some of course, being killed by contact with the oil particles. The unhatched eggs, however, may reinfest the grove in a few days. Pure water, with a power sprayer, is nearly as effectual against the mites and will not ruin the tree as will the oils sooner or later.

But why either, when dry sulphur and hydrated lime equal parts applied throughout most parts of the tree with a blower or even by hand, is the cheapest application known, and is effectual for months, the fumes killing each mite as it emerges from the egg? Sulphur spray, while equally good, is difficult to prepare and ruinous to your machine with no advantage except to stick to the tree better (an advantage more apparent than real.) With the sulphur process more system can be used. Applied after the rains have ceased in the spring, if high grade sulphur is used, your grove is protected till fall, when if a fall invasion is feared, apply again in October. This latter application alone is all that is necessary where silver mite alone is feared on orange trees. I have treated both of the mites in a general way only.

The Silver Mite.

I think I have made an important discovery about the silver mite, which is so little known here (it being so microscopic in size that no ordinary search ever discovers it) but will try to write of it later.

The Scale Bug.

Of the scales mentioned, the black scale produces but one brood each year, and since the advent of the parasite, (Scutellista cyanea), this breeding period has been reduced so that all young should be out by September 1st and, upon young vigorous trees and rebuds, a month earlier. All old scale are then dead and the young ones extremely small and easily killed for two months, and reasonably so for three months.

All The Year.

The red and purple scales, while differing greatly from each other in maner of producing their young and in other particulars, are still nearly alike in their periods of breeding and in their susceptibility (or better their resistance) to treatment, so that for the purposes of this article, they may be treated alike. These insects are putting forth young in some degree at any time in the year, although very sparingly in the colder parts of winter, while by far the greater part of their increase is in September and October. These females die after reproduction takes place, so that it follows that in Noyember there are fewer living old scale and vastly greater numbers of young than at any other season, and as spraying only reduces their numbers and never eradicates these pests, November spraying will kill greater numbers than that done at other times. On the other hand, if this period is awaited, the greatest spread of the infection has been insured as they spread only during the first few hours of their existence.

Treatment.

Summing up then, if we are to use sprays for the mites, we should spray only when they become very numerous on the trees. If sulphur is used, apply May 1st to June 15th and in October. Black scale (if sprayed) September 1st to November 1st, black scale (if fumigated) September 1st to February 1st, increasing dosage for last two months.

Red and purple scale (if sprayed) October 15th to December 1st; red and purple scale (if fumigated) on lemon, any time; red and purple scale (if fumigated) on other citrus trees, avoid the first two months after the young fruit sets.

As to Use of Distillate and of Coal Oil.

I can not answer with certainty, but will say that three per cent distillate is as safe upon lemon as two per cent is upon orange trees. Both injure the trees and fruit, and sometimes terribly, depending largely upon whether delivered under high pressure (thoroughly mixed) or under low pressure, as with hand machines. The emulsions of these oils are much safer than the mixtures, but less effectual killers of the scales.—C. E. Beemis, Covina.

Citrus Conditions in Northern California

THE recent cold spell in California was one to try out citrus conditions as regards freezing, in all sections where citrus fruits are growing. It was interesting for us to watch the effects of the heavy frosts on the lemon and pomelo especially. There are no groves of either of these fruits in the vicinity of Marysville, but isolated trees in door yard collections are not uncommon.

Not Injured by Frost.

The citrus trees of all kinds in the city of Marysville are not injured in the least. A small collection of trees containing Navels, Valencias, seedlings, sweets, St. Michaels and lemons, in full bearing and growing in a low flat section of the country which was flooded during the recent high water, was absolutely uninjured by the cold or flood that followed. The fruit of the lemons was injured to some extent, but the leaves and new growth showed no effect of the frost other than the usual dull appearance which soon gave way to the bright green color when warmer weather and rains came. On my own place is a large lemon tree that was cut back to a mere stub and transplanted a year ago, and having made a new growth of five or six feet last summer, growing late into the fall. This tree was not injured in the least, not one inch of wood was frosted.

Our neighbor a short distance away has in his collection a young pomelo tree which went through the freeze uninjured. We bought three boxes of this fruit for our own use, a month after the freeze and these pomelos are as heavy and full of juice as any we have ever eaten in Southern California.

Moisture.

The conditions accompanying our frosty periods in Northern California are entirely different from those usually occurring in the South. Our frosts are always wet, either following a wet spell of weather or occurring during a wet spell. Our coldest night ended with a fog that left the trees mantled in a bristling frost that stood out over half an inch, giving the appearance of snow. The fog cleared at the time of thawing and all things out of doors received a drenching equal to a heavy shower. The wind changed to the north, drifting back the bay fog and we had two days of freezing, sunless weather with the thermometer ranging from 28 to 36 degrees. Occasionally the wind would veer to the northeast, where it was only 20 miles to snow and the fog would freeze to the trees.

The wind would again change and the trees would drip ice and water. This weather ended with a south fog coming off of the bay, and many sunless days ensued. It was under these conditions that the Northern California citrus belt went through its freeze.

One of the encouraging features of orange culture in Northern California is the tendency of the trees to bear full crops. Those paying little or no attention to orange growing are not familiar with the effect of frost. The majority of trees are in exposed places and the high winds blew much fruit off. The almost universal remark was, "I guess the frost got my oranges, because the wind blows them off." The facts were, the oranges were heavy and solid and full of juice. They were also almost fully ripe, which would have a tendency to make them blow off easily.

Oranges split quite freely in Northern California early in the winter, which goes to show that we can expect to deal with many vexatious problems as well as do our southern friends.

Taking it all in all the outlook for profitable orange growing in this part of the state is very bright. I have been asked if the conditions during the past season have discouraged me from carrying out my intention of planting a commercial grove. Quite to the contrary, I am more enthusiastic than ever on the subject.—J. W. Mills, Marysville.

Citrus Culture in Tulare County

Mr. A. G. Schul z of Porterville, favored us with the following account of Tulare citrus conditions. Mr. Schultz is one of the standbys in the Tulare county citrus section and believes in the future of the citrus in that community implicitly. It is surely a beautiful sight to look upon to ride through the orange groves of Tulare county as did the writer a few months ago and see the foothills of the Sierra Nevadas covered with orange groves which are bringing in wealth and fame to Tulare county.

Development and changes follow each other in rapid succession. What is scarcely known, or is deemed a luxury today, will in a great many cases become a necessity tomorrow; and the orange has certainly not escaped this trait of the human family.

Twenty-five years ago oranges were bought mostly by the wealthier classes, now the person who does not buy oranges is an exception; and this universal demand is, of course, responsible for the extension of the orange industry.

Local Citrus History.

Tulare county did not feel the impulse of the development of the orange industry, until the latter eighties, when oranges were first planted here in commercial quantities. To be exact the history of the citrus industry is as follows:

In 1863 Mr. D. Gibbons and Mrs. H. M. White each planted a few orange seeds, from which they raised perhaps a dozen trees that bore some of the finest seedling oranges ever produced in the state. This fruit took first prize at the Los Angeles Citrus Fair in 1883 and again in 1892.

Encouraged by the showing that these trees made, Mr. Albert Henry in 1882 planted sixty or seventy trees, that were shipped here from Southern California, and this plant proving a success, induced Mr. George Frost of Riverside, Cal., to interest some of his friends in this section, which resulted in their planting about one hundred acres during 1888 and 1889. From this time on, planting continued steadily, until at the present time, there is a continuous stretch of orange orchards, from a few miles north of Exeter, to ten or twelve miles south of Porterville, comprising an extent of about thirty miles, skirting the foothills, and yielding an output this year of over 2500 carloads. To understand what these figures signify it must be borne in mind that this is all a new district, and that the bulk of the orchards are not yet bearing. At a conservative estimate we should double this output in the next three years.

Our commercial record is as well established as our show or fair record proves. Owing to the absence of early fogs and sea breezes, our climate during the summer and early fall months is more equable, and the absence of chilly nights permits the uninterrupted development of sugar in our fruit, which is the reason of even a green orange showing a very high percentage of sugar, and insuring it to color when picked quite green.

Ship Early.

We endeavor to have the bulk of our crop in the packing house by the middle of November, and by the 10th of December the hum and buzz of the orange has ceased until the next season.

The climatic conditions which are responsible for our fine oranges, also evolve for us out of nature's laboratory a lemon, which for keeping qualities, appearances and acidity are hard to equal. Our dry atmosphere produces a rind which is solid and compact, and capable of resisting decay much better than the same fruit raised in a more humid climate, and our frosts are not severe enough to injure either the fruit or tree. Wherever the lemon has received the attention that it requires, it has proven a success and a money maker, as a good

many growers in our midst can testify.

Returns.

Perhaps a few words in regard to the monetary returns of this industry would not be out of place, as this seems to be the standard by which we measure the success or failure of the majority of our efforts.

Of course, every undertaking carried on for gain depends largely on the personal efforts and ability of the person handling the affairs; where the qualified man makes a success, the other one makes a failure; but any intelligent person who is willing to follow a few simple rules, and is not afraid to work can make money at this industry here.

Most of the newer sections receive their irrigating water from wells, an abundance of water being found at a depth of one to two hundred feet; this is brought to the surface either by electric power or gas engines, making the cost of irrigating only a little more than with gravity water.

The great improvements that have been made in pumps, and the reduction in cost of power, by the gas engine and the electric power plants, have enlarged the area of orange planting to an extent not dreamed of ten or fifteen years ago, and have made some of the finest land in the state available for citrus planting which heretofore was considered almost worthless.

Free from Pests.

The one great advantage claimed for this section is the early ripening of the orange; but in my opinion the fact that we are entirely free from injurious insect pests or scale is a far greater advantage. There is today not a citrus producing section of equal extent, that can show as clean a record; not a red or yellow scale, not a purple scale, not a black scale, to mar or smut our fruit.

Is this not a great blessing? Ask the grower, who has to fumigate or one who has to wash and scrub his fruit. By diligent and conscientious work, we have so far kept the district clean, and now that its importance is still better understood, and the extent and value of the industry has so much increased, there seems no reasonable doubt, that this policy will insure us the same protection in the future.

Co-operative Marketing.

Our fruit is marketed principally through the California Fruit Exchange and the California Citrus Union; the Exchange, I believe, ships about 50 per cent of the fruit. There are also a few firms which ship a limited amount of fruit.

Got To Work.

If anyone should inquire about the drawbacks that there are to this industry, I certainly could not give him much information, for, so far I have only found one, and that is, one has to work to make a success even in the orange business.—A. G. Schulz, Porterville.

The Desert Producing Oranges

A year ago when the Cultivator issued a citrus number Mr. D. G. Whiting of Heber, told us of the possibilities of growing oranges below sea level. The hopes which he then expressed for the citrus industry for that section have been strengthened by the past year's experience. His statement as to the lowest temperature and the highest temperature which appears in the following article and the fact that the trees have, during the year, shown a marvellous growth goes to indicate that from a citrus standpoint the future of Imperial will be fully as great as has been hoped by its most ardent supporters. So far as we have ever heard the citrus fruits of the Imperial valley have been praised by all who have eaten them.

I AM glad to be able to tell you that the health, growth and fruiting of the few trees already in bearing has fully met our expectations of a year ago. Several orange trees, three years old, in their fourth year from planting, have produced more than a box of fruit each, pronounced by expert orange growers to be the very best quality. The same trees have grown to a height of nine or ten feet and about the same in breadth. A Villa Franca lemon tree the same age, and cut back four or five feet the year before, is very much larger, and has already produced more than three boxes of lemons of the finest quality. As near as I can learn there were about 200 acres planted to oranges last year, also a few lemons. All are reported as making an exceptionally good growth. Before that only a few had been put out for experiment, by a dozen or so different parties; less than an acre all told. There is no settled method or time for irrigation. Mine have been irrigated about once a month during the summer, going two or three months in winter. Our total rainfall this winter so far is less than 1 inch. What you on the coast designate as a wet season, does not occur here. This is a dry climate, in fact.

Trees are planted about the same distance apart as in other sections, mostly 20 feet.

The Washington Navel is considered the best variety. I have never seen any trees protected from heat. Plenty of water is all the protection they need, but the water, when irrigating, must not stand too near the trunks or they will scald in hot weather. The hottest weather recorded in the past six years has not exceeded 118, and I think has reached that point but three times. The coldest weather recorded this winter was 33 degrees, a point reached three different mornings. The tender new growth on the lemon trees has not been injured in the least, and the trees have never been given any protection.

The oldest lemon tree has been blooming more than a month and has many young lemons larger than peas. The orange trees are just budding. We are experimenting along several lines. If we can hasten the blossoming and setting of fruit by a certain method of applying the water, and then by taking advantage of heat and sunshine in summer produce a ripe orange in October, where! oh where! will the sour orange be when it comes to the early market? Our oranges were ripe and sweet early in November last year; in fact they were quite sweet in October, although showing no color.

The citrus industry surely looks very bright to us here in the Imperial Valley and a large acreage will be planted out this season.—D. G. Whiting.

THE KIND GARDENER.

"Willie's digging out the lettuce!
Bessie's pulling up the peas!"
"Precious darlings! Let 'em go it—
Anything, you know, to please."

A New Hampshire newspaper man who is very fond of honey visited a nearby city, and at one of the hotels he was served with some that was delicious. He enjoyed it so much that he told his wife all about it when he returned home.

On his next trip to the city she accompanied him. They visited the same hotel, and when the noon meal was served he said to his wife he hoped they had some more of the honey.

It did not appear, however, and, beckoning to a waiter, he said: "Say, Sam, where is my honey?"

He was almost paralyzed when that worthy grinned and replied: "She doan' work here no more, boss; she done got a job at the silk mill."

The wife received a handsome new dress before they returned home, after making a solemn promise not to tell the story.—Boston Herald.

SALZER'S SEED PRODUCE.

We recently saw a letter from Wm. Underwood, of Patchogue, N. Y., addressed to the John A. Salzer Seed Co., La Crosse, Wis., that has this to say:

"I planted Salzer's Independence Corn. I sold 7000 ears before the first Sweet Corn of other gardeners around Long Island was ready to eat. I sold them as high as $2.50 per 100 ears.

"I planted Salzer's Earliest Cucumber seed and first, last and all the time, I think that Salzer's Earliest are the greatest I ever saw. They are such bearers, and so fine."

When Your Tools Need Grinding

It is but the work of a minute to sharpen a chisel, a plane, a knife or any edged tool on a **Keen Kutter Grindstone.**

Made of very carefully selected Berea grit—mounted on an extra braced tubular frame that never sways or "wabbles." Ball bearings and double tread make it run as easy as a bicycle. With this grindstone and an outfit of

KEEN KUTTER Tools and Cutlery

you are always ready for the finest or heaviest work.

Keen Kutter Tools are tempered for lasting edges and once sharpened stay sharp indefinitely.

For the home they are ideal, doing better work with less attention than the ordinary nameless kinds.

Remember the name and look for the trademark next time you buy any tool—whether it be a hammer or a saw, an ice pick or a can opener, a bread knife or a cleaver. Then you are sure of satisfaction; for all Keen Kutter Tools are guaranteed.

If not at your dealer's, write us.

CALIMYRNA FIGS

The Best Fig for Commercial Purposes

This is the genuine Smyrna Fig of commerce and the only one worth planting. We were the first to produce this fig in the United States and to demonstrate its great value. We have a splendid stock of these trees for sale.

"The Smyrna Fig at Home and Abroad," by Geo. C. Roeding, postpaid for 50c

The New Grape

The new grape Dattier de Beyrouth, promises to be one of the great shipping grapes of California. The horticulturists in the warmer sections of California, Arizona and Texas should give a few of these vines a trial. It is somewhat earlier than the Malaga. The berries are of a beautiful amber color and further than this they are very large in size. The carrying qualities of this grape have already been fully demonstrated. In addition to its value as a shipping grape, it makes a most excellent raisin and it is the only variety used in Smyrna for raisin purposes outside of the Sultanina Blanche (Thompson Seedless). It is also well adapted for wine purposes.

Burbank's New Creations

We are sole propagators and disseminators for all of Burbank's new creations and have a splendid stock of his wonderful tree productions ready for planting.

Santa Rosa Plum, Rutland Plumcot, Gaviota Plum, Formosa Plum, Vesuvious Plum, Royal and Paradox Walnuts.

A beautiful Burbank booklet, illustrated in colors, telling all about these trees, will be sent to any one upon receipt of 25 cents.

FRESNO, CALIFORNIA

The Oranges of Fresno Foothills

Fresno county has never had a great reputation as a citrus center. It has, however, gone on developing those sections which were congenial to this king of the fruits. The Cultivator wished for this issue a short statement concerning citrus conditions up there and applied to that busiest of all men, Mr. Geo. C. Roeding for such information as he had at hand as to citrus productions. It being the busy season of the year Mr. Roeding has been unable to give very extensive attention to the matter, but the following concise statement shows that Fresno is on the citrus map of the state.

FRESNO county ships on an average of 200 cars a season. The shipments for 1908-09 up to date are about 175 cars. There are quite a number of young citrus orchards located around the city of Fresno and all of them have been quite profitable in recent years. I know of one orchard located about six miles from Fresno, consisting of 14 acres, which has paid a net income of $4000 to $5000 a year in the last six to eight years. This is sufficient evidence of the success of orange culture on the plains in this particular locality.

The great advantage which Fresno possesses over other localities where there is not so much heat during the summer months, is that the oranges ripen from a month to six weeks earlier, and this gives us an opportunity of getting our fruit on the market to take advantage of the Thanksgiving and Christmas trade. Within the last five years very extensive plantings of oranges have been made along the foothills of this county. These trees are doing remarkably well and producing fruit of a very high order. The soil conditions are practically the same as those in Tulare county, so there is no reason why Fresno should not become a factor in the citrus fruit business. There is every reason to believe that the industry will extend from year to year and it is really remarkable the amount of interest which has been manifested in citrus culture at the present time not only here but in all sections of the state. Probably about one-half of the growers of this county are affiliated with the California Fruit Growers' Exchange. Thus far the planting of varieties has largely been of the Washington Navels and Thompson's Improved. During the last two years the demand for Valencia Lates, however, has been very heavy indeed. My private opinion is that the Navels will always be a better variety to plant here than the Valencia. Still the enormous profits which have been derived from the Valencia Late oranges in recent years are undoubtedly the cause of the great demand for this variety.

Lemons are not very extensively planted and in our opinion they are only adapted to the warmer sections along the foothills. One of our most successful lemon growers is N. W. Moodey and it is a well-known fact that his orchard has been enormously profitable. He has in the neighborhood of 20 acres in lemons in the thermal belt along the foothills of the Sierra Nevada mountains.—Geo. C. Roeding, Fresno.

Railroads Can Assist Farmers

ON account of the National Corn Exposition held in Omaha, Neb., in December, the railroads, recognizing the value of better and increased crops of corn, hauled free the exhibits intended for that exposition. Extra baggage cars were carried, which stopped at the county seats, and the exhibitors had only to haul or express their corn, wheat, oats, or alfalfa to the nearest stopping point, from which these goods would be carried to Omaha without charge. The exposition furnished with each car an attendant who was in charge from the starting time until its destination was reached, and looked after the exhibits. This insured their arrival at Omaha in the best possible condition and in good time. This favor was much appreciated by the exhibitors and farmers throughout the great corn-growing belt.

The railroads are much interested in the production of profitable grain crops, since it not only means many more tons of grain to haul, but more carloads of fat cattle, hogs and sheep. It means greater prosperity for the farmers, who will then buy more farm implements, wagons, automobiles, building material, clothing, etc., the transportation of which increases the earnings of the railroads. Since this is all true it is unfortunate that the railroads charge such a high rate for handling commercial fertilizer. According to statistics, in 1907 the tonnage of commercial fertilizers in the United States was 5,000,000 tons, and for handling the raw material, complete mixtures, etc., the total earnings of the railroads was $25,000,000. This does not include the freight paid on coal, bags and supplies used by the fertilizer plants, nor the transportation paid by the traveling salesmen.

As Professor Francis Wyatt has said: "Nothing can stem the demand for artificial fertilizers." Their consumption is increasing daily, and this because a profit always follows their intelligent use. A ton of fertilizers will produce, on an average, three times its weight in farm products. This is accounted for by the fact that the soil is usually deficient in but three ingredients, nitrogen, phosphoric acid and potash. The fertilizers supply these three ingredients only, while the farm products contain a number of other elements which the fertilizers assist in abstracting from the soil. The supply of barnyard manure is wholly inadequate to return all the plant food that has been removed by large yields of grain, fruit and grasses, and fertilizers will, without doubt, be used more liberally each year.

In some states the railroads have generously supplied lecture and demonstration trains and have sent them to all parts of the states, carrying experiment station men and other able lecturers to address the farmers on how to improve their soil, their crops and their general condition, have taught him how to use fertilizers intelligently, and then, when the farmer wished to purchase fertilizers, he found that the railroad charged almost a prohibitive rate, especially when less than a carload was ordered. Since the earnings of a railroad company will rise or fall in accordance with agricultural prosperity, it is to be hoped that they will soon reduce the rate on a commodity which, when properly used, will increase the yield of farm products and thus give the farmer additional purchasing power.

Fair Visitor—So you have really decided not to sell your house?

Fair Hostess—Yes. You see, we placed the matter in the hands of an estate agent. After reading his lovely advertisement of our property neither John nor myself could think of parting with such a wonderful and perfect home.—Tit-Bits.

"Ma," remarked the small boy, "isn't it funny that everybody calls little brother a bouncing baby?" "Why do you think it's funny, William?" returned his mother. "Because, when I dropped him off the porch this morning he didn't bounce a bit; he just hollered."

A young cigarette smoker watching the monkeys in a menagerie, said to the keeper, "Would it do any harm to offer one of them a cigarette?" "Not a bit," replied the keeper; "he wouldn't touch it. A monkey isn't half as big a fool as he looks."

SOME SATISFACTION.

It costs a lot to live these days,
More than it did of yore;
But, when you stop to think of it,
It's worth a whole lot more.

—Judge.

California Fruit Growers Exchange

Eighth Floor H. W. Hellman Building, Los Angeles

Foremost of All Shippers

In advertising California oranges and lemons.

In obtaining packing materials at reasonable prices.

In protecting transportation, refrigeration and tariff matters in connection with the Citrus Protective League.

In even shipment of fruit and proper distribution in the markets.

Thru advertising, experience so far shows that 50 per cent more oranges can be forced into consumption without lowering the net return to the growers.

Thru long time contracts, experience shows that box shook can be bought at a fair figure and without the hold-up prices that have sometimes prevailed in the past.

Thru proper duties levied on imports of oranges, experience shows a vast growth in the California orange industry and with a duty on lemons of 1½c per pound, experience will show a like growth of the lemon industry.

In even shipment and even distribution after shipment, the experience of the last few years shows that the Exchange policy of adjusting its business thruout the country to fit that of its competitors without antagonizing them, is a winner.

Can the growers afford to do business outside the Exchange? If so much can be accomplished with 55 to 60 per cent of the crop in the Exchange Fold, could not much more be done with increased benefit to all if 75 per cent acted together?

California Fruit Growers Exchange

DEAD CITRUS WOOD

Is more or less prevalent in every orange and lemon grove, i. e., trees that are unprofitable. How many such have you in your orchard? Would it not pay you to put paying trees in their stead?

Your Home Grounds

Should contain at least a few trees of the better varieties of oranges and lemons. For this purpose we have some exceptionally fine trees to offer, being grown as specimens. Possibly you would like to plant a few citrus trees about your home this season. If so, will you do us the favor to correspond with us about it?

Citrus Fruits

Historically, Horticulturally, Commercially.

Our new booklet gives more valuable information about varieties, methods of planting, cultivating, pruning, picking, packing and shipping than anything of its kind ever issued. Sent anywhere for the small sum of 25 cents. Correspondence a pleasure.

Oranges in Imperial Valley

The following article written by Mr. H. C. Oakley and printed in the Brawley News gives the citrus situation in the Imperial Valley very forcefully. Plainly the Imperial people will be a factor in supplying the early orange. We do not think the lemon will be as successful as the orange. It may be a good grower but do not think it will be as good shipper as the coast grown lemon. We do not assert this positively for the Imperial Valley has upset too many theories to make positive assertions safe.

THE conditions for citrus fruit culture in the Imperial Valley have been so far proven during the past five years that I now consider it is reasonably safe to advise anyone looking to citrus culture as an occupation that the north-western part of the valley today presents a most promising field, when the price of land and water, character of soil, time of ripening and small necessary cost of fertilizer for the bearing orchards are taken into consideration. Necessarily a great deal has yet to be learned. Five years of careful study of the experimental grove in the Imperial Investment Company's grounds at Brawley, together with other scattering citrus trees in various parts of the valley warrants the above conclusions.

The great problem confronting us today, and the one which contains an element of risk is, "what variety to plant." The older orange growing sections of Southern California went through the successive stages of experimentation and finally evolved the fact that the Washington Navel and Late Valencia oranges and the Marsh seedless grapefruit and the Eureka, Lisbon and Villa Franca lemons are the true staples, with the tangerines, bloods, Mediterranean sweets and seedling oranges adapted to certain sections, due to local conditions of soil and climate. In the proven orange territory of Southern California, it has been demonstrated that the Washington Navel produces a superior quality of fruit in certain localities widely scattered from each other, when to all appearances to the casual observer the soil, water and climatic conditions are identical, and the same is true regarding the late Valencia, and of the different varieties of lemons. Again it has been demonstrated that the Washington Navel tree is rather a shy bearer in the orange growing section of the Salt River Valley, Arizona, and at Yuma, where climatic conditions are quite similar to the Imperial Valley. The prices obtainable for the Arizona fruit for the past three years, in direct competition with the Northern and Southern California crop, clearly show that one-half the quantity of fruit of such a quality at that season of the year will bring more money to the grower than can be had for double the amount of other fruit.

The quality of Washington Navel oranges grown at Brawley is fully equal to the best Arizona, and ripens even earlier than in the Salt River Valley, but is apparently subject to the same characteristic of being rather a shy bearer as compared with other sections of California, but fully as heavy as in the Salt River Valley. It is therefore a safe tree to plant. The experimental orchard in the Imperial Investment Company grounds surrounding its office at Brawley, contains the following varieties: Washington Navel, Thompson Improved Navel, Navelencia, Late Valencia, Tangerine, Imperial grapefruit, Villa Franca lemon and Seedling orange trees. These trees were planted five years ago last May. The Washington Navel and Thompson Improved Navel have borne a fair crop each year since the first, increasing as the trees attained size. The Navelencia, Tangerine, late Valencia and grapefruit have all borne remarkable crops for the age of the trees. The trees are planted 10x20 and surrounded by large encalyptus and Carolina poplar trees on two sides and by a large grape arbor on another side, thus having only an indifferent chance to do their best. It has also been impossible in so small a space to give them the usual thorough orchard care. Notwithstanding all these drawbacks they have made a most remarkable showing. During the past three years I have taken pains to have samples of the fruit get into the hands of the manager of the Southern California fruit exchange as well as other experienced orange growers and handlers, at the time when the fruit was at its best, in November, and I have yet to find any one who failed to praise it in the highest terms. I have noted from year to year that the Navelencia and the late Valencia trees especially, were both very heavy bearers. The Tangerine orange is most promising. Ripening as it does here in November and December, attaining a deep red color and a fair size, it comes in at a time when the regular California crop is only fit to look at and not very good for that. It is a very heavy bearer and very profitable if ripe and sweet for Thanksgiving and Christmas trade. The grapefruit is second only to the Navelencia in promise of large returns. Ripening as it does also in October, November and December it will command the market west of the Rocky Mountains until such a time as the California crop gets to be fit to eat.

My observation of the few lemon trees that have fruited in the valley leads me to believe that it should be placed third in the list of citrus fruits that can be profitably grown. The quality is most excellent but so far as my observation goes the crop will come in at a time when the largest part of the California crop is in, and hence will come into competition with it, and the same would be true of the Late Valencia and Seedling oranges to some extent, while the Navelencia, Navel, tangerine and grapefruit crops will fit into the time in the market between the late Valencia crop of Southern California and the early navels of the Northern California groves at Thanksgiving and Christmas time, bringing us the cream of prices for the rich, sweet fruit that we can produce.

"The woman who strengthens a husband's belief in himself is a rare wife," observes Appleton's. Yes, and the woman who supplements that by strengthening his trousers buttons and reinforcing his shirts in various particulars, is still rarer. In short it's a rare combination.

An Undetermined Name.—Caller—What's your name, little girl?"

Little Girl—"Dorothy."

Caller—"But what's your last name?"

Little Girl—"I don't know what it will be. I'm not married yet."—London "Globe."

"Tommy," said the boy's father sternly, " where are those six apples I left on the table?"

"Father," said Truthful Tommy, "I did not touch one."

"Then how is it that there is only one apple left?" demanded the father.

"That," replied Tommy, "is the one I didn't touch."—"Chums."

A large acreage of Thompson seedless vines has been planted near Yuba City.

HARVEY SPRINGS HELP CROPS PAY

Competition in the fruit, egg and vegetable markets and in general farming has made the Harvey Bolster Springs a necessity for farm wagons.

Farm economy demands the adoption of the Harvey Springs, for they double the life of the farm wagon. They can be applied to any farm wagon in two minute's time.

The Harvey Spring Co., 411 17th St., Racine, Wis., guarantees them to retain their strength and elasticity for years, and in proof of their own confidence will allow any farmer to equip a wagon with the springs and use them for 30 days, free of charge, as a test. They invite farmers to write to them on this matter, giving the weight of the heaviest loads they haul and their dealer's name. The Harvey Spring Co. will then arrange with the dealer to give the applicant a set of springs for 30 days' trial, and will also mail to the applicant a complete catalog telling all about the Springs.

SAMSON WIND MILLS

Have double gears, removable bearing and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.

This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Organized to Fight Pests

THE Cultivator has referred to the organization of Highland fruit growers, the object being to prevent the introduction to that section of any pests injurious to the great citrus orchards. Or further, should these pests be introduced, to have a strong organization willing and able to take up the fight and carry it to a successful conclusion. In the entire district are about 4000 acres of citrus orchards. Practically all of this has already joined the new movement and it is safe to predict that it will be handled with sufficient intelligence to make it a great success. The movement is not alone confined to Highland, for other sections are considering similar organizations. We do not know that they are patterned after this one, but the aim in all is practically the same. Wishing an authoritative statement as to the scope and plan of organization, we have from Mr. S. H. Barrett of East Highland the following short statement together with extracts which we have made from the by-laws of the organization, or rather, the Growers' Agreement. Regarding the movement, Mr. Barrett says: "I can assure you that Highland considers her freedom from scale a valuable asset and we are taking every possible precaution to prevent the introduction of any dangerous pest. Through the initiative of the Highland Chamber of Commerce we have organized the Highland Protective Association and have signed up about 3400 acres out of a possible 4,000. The copy of by-laws will show you the modus operandi of the organization and we feel confident that we can hold the enviable position of freedom from scale, freedom from frost, and wear the Gold Buckle of the Citrus Belt of Caffifornia."

From the Growers' Agreement we take the following purpose and provisions: "The purpose of this agreement is to provide a common fund and secure efficient co-operation for the protection of the orchards of the subscribers from scale and other insect pests. * * *

"Any person or corporation shall be eligible to become a subscriber who shall be the owner of land within said area, and which shall at the time of subscription, be planted to orchard or nursery, provided that after the first day of January, 1909, no party shall be eligible to become a subscriber whose orchard shall at the time be infested by scale or other insect pest.

Every subscriber, at the time of signing this agreement, shall annex to his signature the date of his subscription, together with the number of acres on account of which he subscribes, and such designation of the land shall be sufficient for its identification; and he shall at the same time pay to the person or committee authorized to receive the same as hereinafter provided, a subscription fee of $.25, (twenty-five cents) per acre of such land."

Other provisions such as the privilege of a member withdrawing from the Agreement in case he sells his property, also for the new purchaser of the property becoming a member, together with the manner of handling the funds and collecting same, and the manner of voting and electing officers or directors follow. Again we quote from the Agreement:

"Whenever the County Horticultural Commission, or any board or officer having lawful jurisdiction in the premises, shall lawfully require any trees growing upon land of any subscriber, to be fumigated or sprayed or otherwise treated, to prevent or destroy scale or other insect pest, or shall lawfully require such subscriber to pay the cost or charge of such treatment, it shall be the duty of such subscriber forthwith to notify said executive committee, through the member in his section, of the fact, and thereupon it shall be the duty of said committee or the member so notified, for and on behalf of such subscriber, to cause such trees to be treated under the direction of the County Horticultural Commission, and such cost or charge to be paid out of and to the extent of any moneys in the hands of said committee or that shall come to its hands, or, if such cost or charge be in the first place paid or advanced by such subscriber, then to return the amount thereof to him, out of and to the extent of such moneys.

"Whenever said general committee, by a majority vote of all its members, shall determine that the common interest or benefit of all subscribers require that any measure, other than or in addition to any lawful requirement aforesaid, should be taken to protect the trees upon the land of subscribers generally, or upon the lands of any subscriber, against the introduction or spread of scale or other insect pest, it shall be the duty of that committee to report such determination to said executive committee, and to direct said executive committee to carry out such measure, and thereupon it shall be the duty of said executive committee to carry out such measure, to its extent of its means to do so, after first providing or allowing for the cost or charge of any lawful requirement aforesaid.

"In order to provide means for defraying the expense and carrying out the purposes aforesaid it shall be the duty of said executive committee from time to time, as occasion may in their judgment require, to levy assessments upon all subscribers in proportion to the number of acres covered by their respective subscriptions, and not exceeding in any twelve months an aggregate of $1.00 per acre."

Other provisions follow such as penalty for non-payment of dues, duties of the committee, and the statement that this Agreement shall be in force until the first day of January, 1914, at which date the agreement shall terminate.

Kings County has a supervisor who has secured the name of The Good Roads King.

ENLIGHTENED SELF-INTEREST.

There is one motive behind all business dealings, the mainspring of all business transactions. People buy and sell with one fundamental object—the hope of gain. It is a matter of self-interest pure and simple and doubtless will remain so to the end of the chapter. The difference in merchants lies in the fact that this self-interest may be brutal and unprincipled with the result that it is short-sighted and considers only temporary gain or that, on the other hand, it may be controlled by the highest aims and be rewarded by permanent success.

In the United States one of the most conspicuous examples of self-interest wisely consulted is the seed business of D. M. Ferry & Co. We do not know how it would be possible better to serve the purchasing public than by their method of supplying annually every local dealer in the country with seeds freshly put up and then at the end of the season removing from the retailer all stocks left on hand, thus preventing the possibility of unfit seeds being carried over for another spring. By regarding primarily the interests of the purchaser, D. M. Ferry & Co., have grown to be the largest seed-house in the world. This success has necessitated systematic organization and made it possible not only to specialize but to have the best physical equipment in America.

Learn more about reliable seeds by writing to D. M. Ferry & Co., Detroit, Mich., for their 1909 Seed Annual which is sent free on request.

Save Time—With the Brewster Picking Sack—Save Fruit

A new method sack—invented and perfected by lifelong growers. Eminent orchardists pronounce it perfect. Those who have tried it say they would not be without it. Actual tests show that a man can pick twenty-five per cent more fruit with it and with greater ease.

Sack forms semi-circle about picker's body—is supported by straps over both shoulders and held tight by belt around body. The picker can thus work with ease either on ground or ladder. When full, it does not extend below the hips.

A great feature of the Brewster Sack is the patent gate (see illustration) WHICH PRACTICALLY ELIMINATES BRUISING. Simply unfasten a hook—the gate drops—and the fruit can be quickly but very gently poured out.

The sack holds as much fruit as the old style sack.

Made in two grades.

Regular picking sack grade, sent express prepaid for $1.50.

Special extra quality—that will outlast two ordinary picking sacks—express prepaid $1.75.

Sierra Madre Sack Co., Sierra Madre, Cal.

We want reliable men in every locality to demonstrate this sack and act as our agents.

405 Magnolia, Ave. Whittier, Cal.

HARVEY BOLSTER SPRINGS

Change your farm wagon into an easy riding Spring Wagon in 2 minutes. Fruit, vegetables, eggs and live stock won't damage over rough roads—thus bring more money.

Most wonderful money-savers you ever saw. Double the life of any wagon. Sold on trial. Write today for particulars. Postal will do.
Harvey Spring Co., 737 17th Street, Racine, Wis.

PREPAID

Raspberries, Surprise, Superlative, Kansas Blackcap, 75c doz.
Blackberries, Mammoth and Rathburn, 75c doz.
Phenomenal Berry, London Red, Golden Queen, 75c doz.
Cuthbert, Gardena and Lucretia Dewberry, Logan, 50c doz.
Asparagus Roots, Barrs, Palmetto, Columbia, 1 yr., 30c doz.
Walnuts, Fruit Trees, Flowers.

Pioneer Nursery, Monrovia, Cal.

FIGHTING PESTS.

(Continued from page 211.)

service, while the very best we could have under the existing conditions, has been utterly inadequate in keeping us fully and positively informed as to the scales now in all our orchards, and as to the exact infection movements of the red and purple scales and the mealy bug, which are now near to us, and which are infinitely worse pests than anything we have at present. Success in holding these back and keeping our region clean will depend first and foremost on a rigid and thoroughly efficient inspection service. This is the statement of the case by Professor Cook, who has given many years of close study to the matter, and I believe that he has put it exactly right. The citrus growers of this region have now taken a most progressive and energetic preliminary step in the direction of organizing and maintaining such a service, and, as you know, have established a co-operative committee for the sole purpose of bringing this about."

The manner of inspection and reporting are described at length. The grower, the county officers, and the club are notified of any infested tree. A tree is indicated in the report by number as follows: "We have agreed to indicate seriously infected trees by numbering the rows from the east and the trees in the row from the north, thus a given tree may be R. 10, T. 20."

Mr. Baker expresses the belief that the orchardists will have a competent and thorough inspection at a trivial cost. Also that the work of Messrs. Woglum and Maskew of the U. S. Dept. of Agriculture will make more certain the work of fumigation which will enable more perfect control of even the mealy bug.

"Citrus growers have been losing enough through lack of proper inspection and through ineffective fumigation, to carry on this work all over the county as it should be done, and by trained men, and with all the latest and best facilities that such work demands. The keynote of the whole situation is simply this: The growers can easily have it done right, by direct and energetic action!"

As to the mealy bug and its habits, we will quote from the bulletin next week.

As to methods of work Mr. Fred'k Maskew in his address before the club said: "Clean up and destroy by fire all the debris around and under infested trees. Mark your tents, so that you can know the percentage of cyanide you are using and increase the amount until you have stamped this pest out while it is still above ground.

The question of the control of the mealy bug by parasites does not apply itself to the situation at Claremont at all. The infestation is not of sufficient extent to justify the belief that an attempt to introduce parasites would be attended with success. While this is in contradiction to the methods adopted by the two men whom I have repeatedly quoted as having had the most extensive experience in combating this insect of anyone in California, yet I believe my knowledge of conditions in each of these different localities justifies me in making that statement. Peculiar conditions in San Diego county have enabled the most efficient predatory insect attacking mealy bugs in California, Cryptolaemus montrouzieri, to become firmly established in that region, so much so that it can be collected in numbers practically all the year around. Experience has also shown that in perhaps three years out of four its work is as complete in that region as that obtained by any mechanical means of control, thus I consider Mr. Allen justified in the course he has decided to adopt.

* * *

The mealy bug is but one of several serious pests that are striving continually to gain a foothold in your citrus orchards, and it is only a question of time until they will surely arrive. This has been the fate of some of the most carefully guarded citrus districts of this state. The avenues of entrance open to these pests are many, and while as a community you may make and take the most stringent measures governing the movements of trees and plants, and the use of suspected apparatus necessary to orchard management, it is beyond the ingenuity of mankind to control the movements of the wind, the insects and the birds. These are the factors that constitute the true source of danger, in the present instance, and are a constant daily menace in that they furnish the most rapid source of distribution of scale pests from orchard and from the one district to another.

Since it is apparent that it is beyond our power at the present time to prevent the arrival of these pests, it may be well to consider the better way of preventing their becoming firmly established once they do arrive. This, in my opinion, will be found in promptly locating and fumigating each new infestation as soon as discovered. To accomplish this a competent inspection of each individual tree in the orchard is necessary.

THE NEED OF FORESTRY EDUCATION.

IF we may judge from the signs of the times, a new activity is about to be added to the farm—the planting and growing of trees for the uses of the farm and for pecuniary profit as well. Heretofore farmers have gone to the woods for their fences, their houses and barns, and the country in general has done the same thing for its railroad equipment, and a thousand and one things in daily demand. But the woods are fast passing, and reason advises that we must look elsewhere for timber; that we must eventually depend on planted forests for things made of wood.

If so, we should know something about trees and how to grow them; how to plant forests and care for them. Here, then, would appear a new function for the agricultural colleges of the country—the teaching of forestry and forestry experimentation. At present their functions embrace, among other things, agronomy, horticulture and animal industry. Forestry would add another, cardinal in character and intricate, cardinal because of its universal and pressing necessity, and intricate for the reason that so much time is required for the forest production, and also because we have no precedent. It has never been an American industry and the people are without either education or experiment.

If the forests of the country are fast passing; if we are dangerously tending towards a timberless period, it goes without saying that forestry, both educational and experimental, should find a place in our agricultural colleges at the earliest possible moment.

The first thing to settle is the truth or falsity of the foregoing hypothesis—that the forests are giving out. Is it a fact that timber is growing scarcer and scarcer? Is it true that all heavy timber consumers are finding it more and more difficult to procure fresh product from the forests for their daily consumption? Are we to credit the statement that railroads and lumber companies are becoming anxious as to their future supply, and where it is to come from?

If these queries and others of like character require an affirmative answer, as they unquestionably do, then are we face to face with the absolute requirement of forestry education and experimentation in our agricultural colleges? All argument based upon theory is at an end. It becomes an unequivocal demand; an invincible necessity; something to consider; a matter to provide for.—The Denver Republican.

IN THE FIELD.

Go over your farm and bring into shelter the expensive piece of machinery you are sure to find in some field. A half hour's work storing it for the bad weather may save you from buying a new one next year.

Alfalfa may be sown this month, and if the weather is favorable, will do well, as will red, white and crimson clover, all varieties of grass seed, rye, barley, wheat and oats.

CITRUS FRUIT OILS.

The terrible earthquake of December 28, which destroyed Messina, Reggio and many another smaller city in the southern end of Italy and along the northern shore of Sicily, causing the loss of about 200,000 lives, and the destruction of property to the estimated value of $240,000,000, has naturally affected the markets of the world. Of course this has been shown first in the leading exports from Calabria and Sicily as the following extract from a British newspaper shows:

"The destruction of Messina immediately affected the prices of its staple commodities. Citric acid is steadily advancing. Essence of lemon is selling for from 42 to 120 pence (84 cents to $2.40) per pound, and oil of bergamot, which is largely used by the perfumery trade, at from 12 to 30 shillings ($2.92 to $7.30) a pound. Both are being held in the expectation of a greater advance. Oil of sweet orange, which sold for 66 pence ($1.32) per pound, is now double that price."
